Will say a prayer for a safe journey. I really don't think anyone will
notice he on the wrong, at least not in the Chicago area. :^)

Hillbilly_1943 wrote:
>
> yep, the 250 is the most bang for the buck.....

I don't agree. In my opinion, these days, 225s are the most bang for the buck. In other words, nothing has really changed. A push-pull pair of 3/8" flange transistors (MRF455, SD1446s, etc.) is the best deal. In the early days such an amp was called a 75 watt amp. That was back when CB amps were rated using average-reading meters. Later they were called 150s. That's when the shift to peak-reading meters began. Now they're called 225s. The 225 rating is an idealized peak figure. In other words, it's possible but not likely that your 225 will really produce 225 peak watts.

In my opinion, 250s are not a better deal. They are the in-between amps. They are neither the best value or the best performers of the 2-pill amps. If you want the best performance out of a 2-pill you'll get one that uses 2879s and is commonly called a 350. If you want the best deal you'll get an amp that uses a pair of the smaller, more efficient 3/8" flange devices and is commonly called a 225. The 250s are either overpriced 225s that use 3/8" flange devices (like Messenger) or are amps that use lower power 1/2" flange devices like MRF454s or 2SC2290s and are there just to fill-in that manufacturer's line.

Can you give out a source that you know of? The readers on
this group are probably interested in knowing exactly where
to go for fuses and holders that you know for a fact work well.
I've seen alot of fancy looking, gold-plated, supposedly high-
power car stereo stuff that turned out to be a disappointment
when it came to real performance.

I can give a generic source for 100 to 200 amp relays that
anyone can use: any automotive parts store. A starter solenoid
for any old V-8 Ford will work. They are meant to bolt right
to a fender well near the battery, carry 200 amps for short
periods of time, and handle the vibration and heat of an engine
compartment indefinitely.

> But I agree that at 150 amps or more, those AGU fuses do not do a good
> enough job.

No fuse arrangement that I've ever seen can handle 150 amps
or more without significant voltage drop.

> If left with no other choice, I parallel a number of AGU fuseholders
> and count on their internal resistance to balance the currents between
> them.

That's one way to deal with the problem.

I can easily agree with that.

That's were I come in. I don't let an amp out of here unless
the customer is very clear on proper installation procedures.

I think we can both agree that if the source end is adequately
protected a load end fuse is wasteful and redundant.

> > In the other
> > amps I sell (Blue Faces) bypassing the internal fuse is a

>
> Don't thank me for fuse bypassing, because I don't think that is a good
> idea unless you know how the vehicle is wired and fused!

I'm thanking you in-part for the bias reduction mod that really
helps the Blue Face 350s and 450s. Fuse bypassing is only for
those that understand source-end positive DC line protection.
Even then load-end fuse bypassing is only offered as an option.

> For example:
>
> The system 'shares' a 4/0 wire pair between a pirate 16 pill and a 4

>
> The wiring between the modulator and the 4/0 cable starts burning next.
>
> Hopefully, the owner will notice the smoke IN THE TRUNK before his car
> is on fire!

This example is unnecessary because you misunderstood my
gratification.

In any case, with the use of relays, when the driver (or control
operator) is away from the vehicle there are no hot transistor
collectors.

Furthermore, it's very likely that a trace or the C-E short
within the 4 pill modulator will burn into an open long before
there is any fire hazard seeing as how the wire is 4/0. The
4-pill may require extensive repair--but that's the chance you
take when maximum performance is a goal.

> For competition use, I can condone fuse bypassing.

So can I.

> But for the average user I strongly believe that the protective fusing
> should be an integral part of every amp sold...

I don't agree. As long as the customer is made aware of the
situation I think internal fusing is a counterproductive
redundancy.

12. HTX 100 Owners....

Newsgroup: rec.radio.cb
Date: 1999-03-05 00:00:00 UTC
From: Gordy Gale <ggale@pacbell.net>
Message-ID: <36E0DC6F.61D1CD0C@pacbell.net>
Source record: 12
Cross-posted to: rec.radio.swap,rec.radio.cb

I need to know a particular part inside my Radio Shack HTX 100. The cap that's on the top side of the radio, down front right, with the display facing you, just to the right of the .22mf blue cap directly below IC 3 and below the resistor. Does anyone have it's value, or can tell me what's written on it? Seems there is some confusion as to which component gets removed for the mic gain mod. Symptoms are that SSB stops working, but CW output is fine.

```
_________
[_________] <------(IC3)
O - <------(resistor)

Greetings!

On 5 Mar 1999 15:02:06 -0600, While the Monitor displayed an idea
about "Re: What are the dB gain figures for the Wilson 1000?" from
'tnom@muck.net'. The Keyboard responded with this:

:+> >You sure about this? I'll update my notes.
:+>
:+> Yes on the 1/4 wave ground plane with 90 degree radials. This
:+> negative gain is often overlooked in some publications. In others like
:+> (TheTruth About CB Antennas, Sams Radio Handbook) It does list
:+> this negative gain figure.

Oh Geez! LOL!

My "reference" too. Amongst others. ;-)

I had the stuff in my head backwards, and is why I don't like dBi...

Considering the "flurry" of mail I got today, there will be a
Crucifixion on Easter. ;-) [SIC]

I spent most of my day, indoors, and typing my fingers off...;-)

How fitting that today, there is a "Winter Storm Warning" out for us.

Well, I think I've got the problem fixed. Hi, how are you? ;-)

Regards!

Source record: 21

All these "How much gain does XYZ mobile antenna have?" questions got me thinking..... Gain of course has nothing to do with the length of the antenna, gain is a powder that antenna makers can stuff into their coils of course. A large paint can could hold about 87dB of "gain" & make an 87dB gain dummy load that would work better than a 9 element beam. I hear Wilson is gonna "put" 3 more dB of "gain" into the Wilson 1000 next year.

39. Re: So, what's the formula?

Newsgroup: rec.radio.cb
Date: 1999-03-06 00:00:00 UTC
From: tnom@muck.net
Message-ID: <36e0d084.9112407@news1.newscene.com>
Source record: 39

>I forgot to ask you Tnom, what are the different things that odd or even
>lengths accomplish????

I don't really want to start an odd or even thread war but here is a
repost of some information about the odd or even debate.

##

After much discussion on what coax length is proper to use on a
mobile installation, i decided to sum up my thoughts on this subject.
Before i start, i have to say that there is no such "proper" way that
will suit all installations. Each method has its own advantages, and
disadvantages. Each method is neither right or wrong.

These are the three methods discussed here.

1. Using the shortest length possible
2. Using an electrical half (or even) wavelength piece of coax
3. Using an electrical three quarter (or odd) length piece of coax

that is 18 feet long

Each installation of an antenna may, or may not, take advantage of
all of the individual properties of these coax lengths. It is up to
the operator to determine what best suits him.
.....

Method ones advantages:
1. The lowest loss of all methods. *There is hardly any loss in any

method to begin with

Method one disadvantages:
1. If the shortest length falls around the nine foot area, and if this
piece of coax becomes an acceptable counterpoise to the antenna, then
a voltage maximum will occur at the radio. This will cause a high SWR
reading at that point.
.....

Method two advantages:
1. The load is mirrored at the radios end. This gives the most
accurate SWR reading at the radio.

Method two disadvantages:
1. Because the load is mirrored at the radio end, a direct short or
open at the antenna will result in an infinite SWR at the radio.
Whereas any other length other than this length will show a less than
infinite SWR.

.....

Method three advantages:
1. Load variations at the radios end are spread out. This increases
the SWR bandwidth at the radios end. *this does not change the actual
SWR
2. This length, if it becomes an acceptable path for a counterpoise,
will present a voltage minimum at the radio. This will have negligible
effect on the SWR at the radio.

Method three disadvantages: none
.....

It should be pointed out that the first thing you should do is
resonate the antenna at the desired frequency, no matter what method
you choose.

It should also be pointed out that any length of coax can be
used. Its advantages are: The most convenient of them all.
.....

Here is the relationship of the impedance shown at the radios
end of the coax, when using a 1/4, 3/4 or 1-1/4 ect. feed line.

Zms = impedance of matching section, or coax Z
Za = antenna resistance
Zl = line impedance, or what the radio sees

Zms = \/ Za Zl

Or the square root of (Za times Zl) equals Zms

So for example Za = 25 ohms, Zms = 50 ohms, then Zl= 100 ohms
or an inverted but identical match

.....

I have not found a way to express the broadening of the SWR at
the radio with a quarter wave transformer mathematically, but i
have found the reason.

When the antennas resistance at resonance is less than the
characteristic impedance of the coax, this being the normal
case, and if we move off the resonant frequency we find
this.
Because of the inverting action of a quarter wave
matching section, the added inductive reactance at the
antenna, when you go higher in frequency, is partially
canceled by the added capacitive reactance, that
comes from the former quarter wave section, that is now
more than a quarter wave matching section.
The same inverting action takes place if you go lower
in frequency. In this case the added capacitive reactance

at the antenna, is partially canceled by the added inductive reactance of the now less than quarter wave matching section.
One thing should be noted. This inverting action that takes place (adding Xl with < Fr),(adding Xc with >Fr) with a quarter wave matching section inverts itself when the impedance of the antenna is greater than the characteristic impedance of the coax. In this case just the opposite action takes place. In other words.
When the impedance of the antenna is lower than 50 ohms, the inverting action works to increase the bandwidth at the radios end. When the impedance at the antenna is greater than 50 ohms, the inversion that takes place works to decrease the bandwidth at the radio. Once again, normal resonated antennas on mobiles are somewhat lower than 50 ohms.

More specifically, they have negative gain. As do any shortened quarter wave.

Put 4 watts in, get less than 4 watts out ERP.

Hello Dale or is it radiogod: You have forgotten a few things here. The bulls horns on the hood, the fox tails on the car antenna, the rifle rack in the back window, the spittin can in the back, a few empty beers cans on the dash, the "Paradise Trailer Park Parkin Permit Sticker", at least one crunched fender, but two will do, the springs coming out of the seat, the headliner hanging down, bumper to bumper rush and crunch, a few left over rusting holes from all those antennas ya tried back in the 70's, the co-pilots door held on with plumbers tape, and of course the most important thing, the multiple cracks and bullet holes in the windshield.

And probably a hole lot more friendlier than you.

Jay at jay123a@ptw.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

50. Information Wanted on DIGI SCAN.

Newsgroup: rec.radio.cb
Date: 1999-03-06 00:00:00 UTC
From: Richard <43z280@one.net.au>
Message-ID: <36e1169c.0@pink.one.net.au>

I am chasing some information on a Digi Scan, UFO Model made by REDCO, Reliable Electronic Design Company from the US. It is very similar to the Digi Scan DS 400 made by DIGALOG TECHNOLOGY,INC also from the US, but instead of having rocker swiitches to program it has a set of pins which you swap around. This is where I am having trouble.

Any assistance would be greatly apreciated.

Thanks in advance.

Richard.

Did you try it using the same coax and radio for input? maybe the radio he is using or the input match is different.. Or his grounding system is inadequate. You have the volts, so It is either coax match or drive amount or match.

>Good friend of mine has an amplifier that is doing let's say 500 watts at 18

1- new in the box..
2- has it ben open up..
3- or peak out
4- power mic with it.
5-or stock mic with CHs switch on it.
6- CHs done--feq-(26.515--30.9)
7-is audio cut out.

thanks Jim

62. Hot frequency counter?

Newsgroup: rec.radio.cb
Date: 1999-03-06 00:00:00 UTC
From: Power__House@webtv.net
Message-ID: <13139-36E13740-16@newsd-131.iap.bryant.webtv.net>
Source record: 62

I have a Para Dynamics PDC357 counter, and it gets really hot, just being on. I had it apart to have a look, and there is a transistor that is using the bottom cover as a heat-sink, but should it be getting really hot, just sitting idle?

One other question. I have seen newer PDC357's advertised as having a HOLD button. Mine does not have this option, though it has a solder pad on the board labeled "HOLD" with nothing connected to it. If anybody knows what type of setup there is with the switch and the spot on the board, please let me know. Is it a on/off switch, or a momentary push button, etc, as well as where the power (or ground) comes from, that hooks to the switch and then to the HOLD pad, please let me know!

One other thing...The specs that came with it are a crock of shit! I tried to do a radio tune up, and couldn't finnish it because it wouldn't pick up the frequency! It says it has an input sensitivity of 20mVp-p, and I was trying to measure a test point that had 55mVp-p!

Anybod know where I can get a REAL 7-digit frequency counter that itsn't going to drain my bank acount? Or should I write the company and complain about there bull-shit specs?

The PRO-50 covers 30-54, 137-174, and 380-512 MHz. The only way you're
going to get frequencies outside those ranges, basically, is by
getting another scanner that includes the ranges you want.

As for a list of frequencies...mine wouldn't do you much good unless
you're in western NY.

Good Luck...

As far as a radio is concerned the apparent SWR is very real
at the radios end, and the real SWR is of a lesser concern.

March 4, 1999 filename: nss0304.txt

Merle Parton,

In case you don't know the latest developments at NSS,
let me update you.

NSS was decommissioned in early 1996. The sole remaining
facility employee is John Schorpp, the antenna man.

The towers and transmitter building are scheduled to be
demolished by September 1999. There has been an
appropriation of $4.2 million to demolish the site and
convert it to a wildlife preserve.

There is a group of people, including John Schorpp, and
now me, who learned of this development only this past
weekend, that want to stop the demolition and convert
the site to a museum of VLF radio technology.

As a member of the Antique Wireless Association, I wrote
a letter to its president last night, citing the few facts I
know, and asking what it might be able to do to aid this
venture to convert to a museum. The AWA operates a
large communications museum in Bloomfield, NY, just
south of Rochester NY. It has ties with the Smithsonian
Institution.

There is a public hearing in Annapolis March 8, 1999. The
time is 6:00 p.m. of the Lowe Office Building. That's all
the address I have. I have handwritten directions to it that
John Schorpp handed out at a hamfest we attended this
past weekend.

John Schorpp has asked me to ask you to consider putting
a notice of this meeting on the NSS Web page. I know
this is short notice, and there isn't even a complete address,
but let me give you my name and phone number: Pete
Sypher, 301-601-2711. I'm going to the meeting. I'm going
to spend time and effort for this cause of converting the
site to a museum, even though the chances of this being
realized are slim, in my estimation.

73, let me know what you think about all this.

Pete Sypher

In the US, the only legal way to boost ERP (Effective Radiated Power) is to get a good antenna.

No? Well, I've got 5/8 wave 2-meter and a 5/8 wave 440 antenna each
mounted on my car and I'm sure that they exhibit substantial gain over a 1/4
wave antenna.

In the grander scheme of things, the

Ok i have been doing some checking here ..
goldenrod
gain 4.75db
frq range 26.2-29.5mhz
12kw max power
4 foot 3 in height
11 oz weight.

super penatrator
frq rang 25-30mhz
3.5kw max power
longer than golden
heavier
built with stainless steel stronger than aricraft aluminum. I have never owned a golderod (nicename) Ihave had a SP bic-11 for years. I would like to try one. I dont know what the db gain of the SP is I know its 5/8 wave. The problem I have with the 45 is the aluminum construction. Stainless steel will last a lot longer in harsh conditions and it seems that the bandwidth is better on the penatrator across the board. Now as far as max power in well how many of us run 12KW? Or how many run 3.5KW either. Thats a lot of mods you have to do to your vech. And a lot of cash. I am not ripping on people with the 45 at all. I would like to try one and compare. I looked at both manufx sites and they leave out a lot of info on the antennas that would be nice to know. Like the db gain on the SP or the the radiation patterns would be nice too. Well thats my 2 cents worth.

> looking for all-around performance."
> I stand by my writing.
>

The duel antennas will work better that a single antenna, but only by a small amount. If you look at the ARRL Antenna Book, 18th edition and look at page 8-6 you will see that at the two top left hand antenna patterns. These are for two antennas feed in phase spaced at 1/8 and 1/4 wavelengths, and they show a slight amount of gain at the sides, and a slight loss of energy to the front and back. Oh yeah installed antennas will show a difference in gain and energy patterns. How many duel antenna systems are in use today, and they work pretty well. They work good enough to not really tell the difference between a duel and a single antenna, being only a few dB difference.

> > and so does a center mounted single antenna.
>
> A quote from the page:

>
>Frank

I have used a cobra hh35wx. the things i didnt like were: rubber duck antenna fine for very local work, but obviously better range will be had with a loaded telescopic accesory antenna; and, the aa nicads i used from rat shack werent always reliable. one out of the bunch would go bad and spoil the performance of the ht. also, at times, the cells would not make good contact to the radio and i would have to "slap it around a bit" to get it to work.

thus: get an ht with a slide on slide off battery pack for good power reliability; and carry a performance antenna with you when you need the extra few miles. cherokee has one of these antennas, but expensive. rs has a special order one, i think, but probably will break easier(telescopic). less expensive though.

good luck!

Greetings!

On 06 Mar 1999 05:11:37 GMT, While the Monitor displayed an idea about "Re: coax length" from 'icecoldnyc@aol.comIceCold (ICECOLDNYC)'. The Keyboard responded with this:

:+> Hey Toll,
:+> For those that aren't sure.....
:+> What is the difference between REAL SWR and APPARENT SWR??????
:+>
:+>
:+> ICE, ICE & MORE ICE.... ICECOLD Big Apple Trees Just Got Down!!!!!!!

In short...

Real SWR, is what the SWR is, that the system sees.

SYSTEM - means the radio, coax and antenna as a whole. The SWR exists from the antenna standpoint, working with the tuning of itself, to the radios own output.

Apparent SWR, is the point of insertion of the SWR meter into the system, the meters own observation of the SWR at that point in the coaxial line. This can vary. Due to constructive and destructive standing waves that occur along the coaxial line.

Apparent SWR can be thought of as the SWR that exists anywhere along the length of the coax. This may be different from the antennas own SWR it presents to the rest of the system.

To determine Apparent from True SWR, you'll need to use random lengths of coax for the patch cord of the SWR meter. The change of the coaxial length in the overall system, would change the Apparent SWR, while the True SWR will not change.

The apparent SWR will be closer to the True SWR measured at the feedpoint of the antenna. The antennas own SWR should be used to determine if you have Apparent SWR readings at any given point along the coaxial line you check with a SWR meter.

This is the best way I can put it. It all depends of the point of view used for the SWR meters location on the coaxial line. At the antenna, the SWR may be one reading, while at any given point along the coax, you may see a different SWR reading. The coax is placing itself as part of the radiating portion of the system, instead of being a

conductor to transfer energy from and to, the radio and antenna.

There is also another event of Apparent versus True, that's dealing with the change of impedance that occurs between amplifier stages that can cause the overall input and output impedances of the stages' connection to previous, and subequent stages.

Apparent, is like a point of view of an event.

True, is based upon factual, or physical evidence of an event.

Research needs to be done to determine if you are viewing Apparent or True SWR. So, the SWR really should be checked in at least, two points, or at the antenna, and a random length along the line. The differences, if any, give you the SWR at that point, and if it has changed from the antennas own SWR, you are then into a problem with Radiating coax, and the system suffers in performance due to it.

Hope this helps...

about "Midland 77-115" from '"Christan" <nospamcombsad@erols.com>'.
The Keyboard responded with this:

:+> Does anyone know if the Midland 77-115 cb radio has a noise blanker built
:+> into it, I know it has an ANL switch on it but I have seen adds on the
:+> Internet that says it has both a ANL and noise blanker.
:+> combsad@erols.com

None that I know of.

Was working it over on Friday. It only has ANL, but I found that it
also has some very supceptible ears for bleedover.

I found some stuff that you can use to help increase the modulation.
You might have to cannibalize other parts from another radio though.

But, I have yet to find the NB, which I don't think it has. You would
have to upgrade the board in it to do so.

It's missing the stages it would need for NB to work. The board
doesn't have the spaces in which you could "add" in components to
accomplish that.

Source record: 99

Greetings!

On Fri, 19 Feb 1999 09:35:13 -0500, While the Monitor displayed an
idea about "Max performance" from 'CB Guy <solawear@earthlink.net>'.
The Keyboard responded with this:

:+> I have recently bought a Cobra LTD 25 Classic WX radio and want to know
:+> the best way to get the maximum performance out of it. It will be
:+> installed to a 96 F-150 and have 2 Firestik Antennas. I would like to
:+> mount the antennas to the sides of my bedliner if that is where I can
:+> get the best perfomance. Or maybe how I can get the best perfomance
:+> where they will be. Any and all help is appreciated.
:+>
:+> Thank you,
:+> handle name:
:+> SuperMan

Well, welcome aboard!

Let's see, you want to use 2 antennas? And you have a pickup truck.

Well, If you want to use the bed, co-phasing can work well. The only
problem I see is with the height of the bed, to the front cab. It
might cause a problem or two. Height is very important when trying to
be heard, versus buried in the mud.

Co-phasing, requires a harness, and your understanding that the
antennas will have a directional pickup pattern.

If you can live with that, then the following should help you.

If you haven't already, plase visit the Firestik Antenna Company Web
site at http://www.firestik.com and follow along...

You'll need a phasing harness, that uses RG-59, or 72-75 ohm impedance
coax for the phasing to work and tune well.

Mount the antennas close to the mid-length section of the truck if you
want good coverage both front and rear. Closer to the front or back,
and you get very directional with main reception being the longest
section of the metal panels the truck has, for ground plane effects
that will occur and the antennas will work the metal of the truck
better in those directions.

Once the antennas have been located, mounted and you're ready to put
the coax together to connect them, I hope that you've visited the
Firestik site by then. They have the tips you'll need to tune them.

The only thing more I can suggest; If you're using the bed to hold these antennas, get the longest antennas you can accept to use on your vehicle, for height of the cab, and the overall height that the antennas can use for both tuning, and radiation pattern these will develop, higher [or longer length] is better.

If you have problems with noise, you can check out http://www.iserv.net/~codyspc/engine1.htm - and take the test. Then follow the links to areas that you need to look into to help reduce noises present in your vehicle.

Aside from that, the antennas directionality is produced by the interference pattern thats generated by the antennas as they work with and against each other. The lobe patterns are stronger towards the constructive waves that are enhanced by the two fields the antennas generate [perpendicular to the location of the two antennas along the horizontal axis drawn as a connecting line between the two], with the destructive interference from the co-phased signals that, being out of phase, will lessen, or weaken the signal pattern arriving or being sent out, from the paralleled regions.

For phasing, you can use slightly different lengths of coax which will change the pattern these two antennas will generate.

The best method is to use the harnesses that are supplied. These will provide the proper impedance, and the correct phase, the antennas will need to work properly.

Hope this helps.

Miles asked:
>When did 11-meter capable HF gear become illegal?

K5PF:
11-Meter capable HF gear is not illegal. However, it must carry a
type-acceptance sticker. You may be referring to the famous Amplifier Law.

In 1978, the Federal Communications Commission banned the manufacture and
marketing of any external radio-frequency power amplifier or amplifier kit that
is capable of operation on any frequency below 144 MHz unless the FCC has
issued a grant of type acceptance for that model amplifier.

Q. Is it illegal to use amplifiers on 10 meters?
A. No. Amateurs may use such amplifiers. While the rules make it difficult to
BUY a new amplifier capable of operation on 10 meters, the FCC allows amateurs
to MODIFY an amplifier to restore or include 10-meter capability. An amateur
may modify no more than one unit of the same model amplifier in any year
without a grant of type acceptance.
Amateurs may build amps, convert equipment from any other radio service
for this use, or buy used amplifiers. Nonhams are specifically prohibited from
building or modifying amplifiers capable of operation below 144 MHz without FCC
type acceptance.

Q. Can a dealer modify amps if they are sold only to licensed amateurs.
A. No.

Q. What type of amplifiers may a dealer sell?
A. All external amplifiers capable of operation below 144 MHz must be type
accepted by the FCC in order to be marketed. A waiver was issued to amplifiers
manufactured prior to April 28, 1978.

Q. What does Type Acceptance mean?
A. Type acceptance is an equipment authorization granted by the FCC. It is
based on equipment data submitted by the manufacturer and is used to ensure
that the equipment will be used in the proper manner of the service for which
it has been accepted.

Q. Why was the 10-Meter amplifier ban imposed?
A. The FCC said this action had been taken to specifically address the
"illegal use on frequencies in and around the Citizen's Band Radio Service."

While I respect the length of time you have been licensed, I disagree.
"Ticket" is the slang term for "license" and is used in the amateur hobby as
well as professional circles.

If keeping the "ham vs. CB" threads going gives you guys some kind of
fulfillment, please continue. However, you need to step back and take an
unbaised look at how far this thing has been stretched. Arguing over who does
or does not use certain words usually is a sign that a thread has outlived its
usefulness.

It has been suggested that reading a thread beyond the seventh message is a
waste of time. By then, the original topic has been exhausted and it has been
reduced to slurs, name-calling, and inaccurate information.

K5PF
Now observing "The Rule of Seven", or NG-7 as I call it.

Agreed. I recently recalled something which I read early in my venture into Newsgroups. Reading beyond the seventh message in a thread is useless. By then, the original topic has been covered and the thread moves into name calling and slurs. Very little useful information remains.

I call it the "Rule of Seven", or NG-7 for short. Hope others will join you in not oiling the squeeky wheel, Dave!

PUBLIC NOTICE
FEDERAL COMMUNICATIONS COMMISSION
1919 M STREET NW
WASHINGTON, D.C. 20554

May 13, 1996

Extended Coverage High Frequency Transceivers

The purpose of this Public Notice is to clarify the Commission's rules regarding equipment that is intended to operate in various radio services in the high frequency radio spectrum, including "10 meter" Amateur Radio Service (ARS) equipment

The Commission has noted that a number of transceivers imported as ARS equipment are also capable of transmitting and are being operated in nearby frequency bands allocated to other radio services such as the Private Land Mobile Radio Services,Maritime Services, Auxiliary Broadcast Services, International Broadcasting Services, the Citizens Band Radio Service, and the U.S. Government. Operation of this equipment causes interference to the authorized users of these frequencies. Some of these transceivers are capable of using output powers or emission types which are not permitted for the radio services listed above and some are capable of transmitting in the radio astronomy band where no two-way radiocommunication is permitted. Some manufacturers are promoting the sale of conversion kits, or have designed their transceivers such that they can easily be modified by the users, to extend the operating frequency range into the frequency bands listed above. In addition, so called "export' radios which are deliberately designed to facilitate this capability are also being imported and marketed.

Manufacturers, importers, vendors and users of these transceivers are reminded that transmitters intended for operation on frequencies allocated to any of the FCC authorized radio services listed above, except the ARS, must be type accepted by the Commission for the particular radio service(s) in which they are intended to operate prior to their importation, marketing or use. The Commission considers that the transceivers discussed above are intended to be operated on frequencies where the use of type accepted equipment is required because of the simplicity of modifying them to extend their operating frequency range. Transmitters designed and intended for use only in the ARS must comply with the applicable technical standards contained in Part 97 of the Commission's Rules but are not required to be type accepted.

It is a violation of the Commission's regulations to: (1) import or market a transmitter that is designed or intended to operate on frequencies outside of the ARS bands, if it has not been issued a grant of equipment authorization for the radio servce(s) in which the transmitter is capable of operating; (2) import, market or operate a transmitter that requires a grant of equipment authorization but for which no grant has been issued: or, (3) transmit on a frequency allocated to a licensed radio service without the appropriate Commission issued station license. Violation of the Commission's regulations will subject manufacturers, importers, vendors and users of this equipment to appropriate criminal penalties as provided for by federal law(s), including fines and/or imprisonment In addition, the equipment described above can be seized by, and forfeited to, the government

For further information concerning this Public Notice, contact Gary Hendrickson at the FCC Laboratory, 7435-A Oakland Mills Road. Columbia. Md. 21O46, (301) 725-1585, extension 223, or E-maiI: ghendric@fcc.gov.

****

In other words owning an amateur radio is legal without a license. Modifying your own radio for 11 meters is legal (this assumes that the mod was done for receiving purposes). Transmitting is illegal.

114. Copper has poor customer service!!!

Newsgroup: rec.radio.cb
Date: 1999-04-02 00:00:00 UTC
From: icemanrrc@aol.com
Message-ID: <19990402103202.00787.00001514@ng97.aol.com>
Source record: 114

Four times I have called Copper Electronics. All four times the operator is always rude, and it always seems like they are trying their best to get me off the phone as quick as they can. Every question I asked, the operator just let out a sigh. I was ready to order $400 worth of merchandise, but after the operator's attitude, I changed my mind. I told her that when she thought she could answer a couple of simple questions and give good customer service without letting out loud sighs, call me back. No one called me back. I guess that is their loss. But I would not recommend anyone to buy from Copper just for that reason. Good Customer Service is a must!
If you want great service with great prices, call Coaxkid at Left Coast Radio.

The End

>
> But do we encourage it?

I don't.

But I do understand why people do it.

And I encourage good engineering practices.

I'm also one of those folks who advocate giving addicts clean needles and enough drugs to stupify them till they die; because I see it as a cheaper alternative to the war on drugs and a good way to lower the crime rate.

> and when does denying someone access to public
> property constitute a "minor infraction"?

When you agree to accept that interferrence from other stations as a condition of using the band as described in part 95.

> When was a possible $10,000
> fine a "minor infraction"?

When the lawyers get involved.

Kinda like 20 million for 'a dumped cup of coffee'; or 3 million for' tripped on your doorstep'; or 1 million because 'I was a passenger in a car you bumped into and am complaining about whiplash'!

I am not a proponent of any of those things, but I can understand why
people do them.

I try to talk folks out of illegal mods, noise toys, roger beeps,
echoes, dirty linears, and especially out of band operation, because of
the extra problems they bring with them.

- >I am not a proponent of illegal operation, but I can understand why
- >some do it.
>
> But you just expressed an opinion that stated that the average 11 meter op
> needs to break the rules. Therefore you must be a proponent of illegal
> operation.

Stating an opinion does not make me a proponent.

There are supreme court justices who frequently state their opinions on
legal issues; that does not make them proponents of those things they
stated their opinions on.

> Yes, I think it's great that you try and discourage the use of noise toys and
> dirty amplifiers. But you could be doing more.

I am already doing more than you are!

> If you honestly don't condone
> illegal practices (i.e. illegal mods, frequencies, and amplifiers) you could
> stop dispensing advice about how to install, troubleshoot, and perfect these
> illegal devices.

Why?

They will only get that advice somewhere else if not from me, and it
might make their stuff even dirtier!

> I notice a lot of the tech questions in this newsgroup
> solicit opinions on "What's the best [illegal] amplifier to buy?"

And I suggest the one that operates with the least harmonic distortion
and least likely to overload.

The man is obviously looking to but an amplifier, and probably will do
so.

Bt providing direction to a clean running one I have possibly kept one
more dirty running one off the air.

>, or "How do I
> mod my radio to operate on [illegal] frequencies?".

I don't have anything to do with any radio mod questions, so why does
everyone keep saying that I do?

> The "it's for information
> purposes only" excuse doesn't cut it.
> Neither does the "they already own these
> amps" excuse.

I disagree.

> The results of your "advice" have a pretty high probability of
> showing up on the air -- in the form of an export radio transmitting out of
> band, or running illegal wattage.

Now you are really beginning to pxxx me off!

I don't have anything at all to do with radios of any kind and yet you
say I have something to do with export radios transmitting out of band
or running illegal wattage because of what I have posted to this
newsgroup.

You couldn't be any more wrong!

You had better pull up all my posts for the last year and read them
again because Im have NEVER, EVER posted anything like that on this
newsgroup!!!

What gives you the right to make such an accusation without even doing
the research to make sure you have your facts straight!

> I'll grant you this: you are absolutely correct in saying that you are
> perfectly legal. It's true. You don't sell amplifiers. And it's not illegal to
> tell other people how to fix them.

I don't tell them how to fix them!

Find ONE example of where I did......

I answer specific questions from people that are in them fixing them
already.

I make recommendations to make amplifiers run cleaner instead of
dirtier.

I try to educate them as to why they shouldn't overdrive them or run
them without bias.

By doing that I truly believe I am making things better.

> It's not illegal to tell people how to
> modify CB radios to transmit out of band.

I have never, ever, done that.

Don't even suggest I did unless you can quote some old post as proof!

> It's not even illegal to get on a
> public forum and say "the average 11 meter operator needs to break the rules (
> (i.e. illegal mods, frequencies, and amplifiers) in order to communicate with
> each other".

That's true, but even then you are quoting out of contact and not
quoting the whole statement where I said that" I CAN UNDERSTAND WHY the
average 11 meter operator needs to break the rules.......etc.,etc.,....

> But by doing all that, you are contributing indirectly to making on-air
> conditions worse for everybody.

But I am NOT doing all that!

Once again you better do your homework before you start making
statements like that!

> - Your advice results in someone buying an illegal amplifier.

Not true.

My advice may result in them buying a different amplifier; one that
runs cleaner than one of the others they would have purchased without my
advice...

> That's one more
> amplifier getting put on the air,

That amplifier would have been there anyway.

Since I don't sell amplifiers., I cannot stop selling them.

Someone else (usually a HAM operator) is selling those amplifiers, and
the bulk of them are extremely 'dirty' in operation.

I try to direct them to a cleaner running one.

> creating the need for other users to buy
> amplifiers to overcome the interference caused by the first one.

I am not creating the need because I am not selling the amplifiers, and
I am not effecting the quantities of amplifiers sold, I am just trying
to convince those who are going to buy one, to buy a cleaner running one
so there will be less interference overall!

Why is that concept so hard for you to grasp?

> - Manufacturers and distributors of amps specifically designed for [illegal] 11
> meter use are encouraged to come out in the open and begin openly soliciting
> business, creating more amplifiers going on the air and more interference.

Not by me!

Show me a single post where I encouraged any amplifier sales by any
dealer on this newsgroup!

You won't find any!

> - A newbie reads advice given in this newsgroup and comes under the mpression
> that it's OK to use illegal frequencies and illegal power. More amps get put on
> the air, and more interference results.

I can agree with that.

This newsgroup was like that before I got on it and it will be like
that after I am gone.

My presence here has not had any effect on that, pro or con....

What my presence here might have had an effect on is that the newbe may
buy a cleaner running amp if he was going to buy one anyway, and I might
also have some influence in keeping him ON BAND and off the illegal
frequencies.

> << * Is "everyone else is doing it, so I can too" a justifiable argument to
> break
> the law and encourage others (by example) to do so?>>

No.

> In my opinion, the issues we've been discussing (in the context of the
> federally-regulated radio spectrum) are not a minor infraction.

In my opinion you are discussing the issues in the wrong context then.

If the HF part of the radio spectrum (and I mean ALL the HAM
frequencies as well as the CB frequencies) would have been effectively
Federally Regulated all along, we wouldn't have the problems we are
discussing right now.

> They can (when
> enforced) carry heavy fines and penalties.

I think the heavy fines are part of the problem.

There is too much inventive to 'take it to court' and get the fine
dropped or greatly reduced.

I see the problem as being that the 'good' radio operators have are not
empowered to keep the 'bad' radio operators in check.

When they take it upon themselves to try to make things better, they are ignored by the government agency responsible for helping them achieve that goal.

They get frustrated and see that the violator seems to have nothing to fear even when the locals turn him in, so they figure it must be ok to be a violator....

And being a violator is much more fun!

We are battling human nature here gentlemen!

Add to that the money to be made selling those illegal mods and devices and you have a serious problem!

If you are picking on me because you believe I am a 'figurehead' representing the problem, you are aiming in the wrong direction!

Have a good weekend!

Dennis

I have just bought it today it looked pretty good i bought all the stuff for
it so i could use as a base unit i bought a 3amp dc power supply and a smart
cb base antenna i am not getting hardly any range at all i can hardly pick
up anything i got a hand held its a 40 channel Eurosonic and it wouldnt
even get down the road with me speaking to it is it my cb or antenna i live
in the UK if there is anyone with this cb could they please email me and
tell me what kinda a range they get and if they get far what antenna do they
use i fell pretty pissed of paying £100 for the cb
£30 for power suppy i£10 for coaxil cable and £20 for the antenna what is
wrong here.
I am new to CB's as you can see please reply thought
sletchet@dircon.co.uk
Thanx in advance

Now that is a LIE, I can and if need by, I will contact Judy Korp at A1 Telecom and Have her send me documents from past sales records showing that TONY bought and sold refurbished Radios as NEW. and further more, I can and will get

documents showing that tony has bought refurbished products from other suppliers as well.

> FACT: The local ordinance states that it IS legal to sell cell phones or pagers to minors (in Southgate, Michigan) if they have the written consent of their parent, guardian, or employer. However, if the above consent is withdrawn we would, of course, turn off the minor's service until they reach 18. But, many parents WANT their kids to have them so they can reach them any time they want.

Well, Explain why a parent came into your store when I was employed there and was very upset at the fact that you gave her son a cell phone with a FAKE letter of permission to buy the cell phone?

> FACT: We didn't pay "speedbuggy" a single cent for his kind remarks -- he's just a nice person and one of THOUSANDS of satisfied Palco customers.

Yeah, One that didn't get a refurbished radio. Tony, If need be, I'll name you 3 names of people that bought RCI 2950 and 2970's from YOUR store, had problems with them and sent them back to Ranger and received phone calls telling them that they were refurbished.

> FACT: Palco is an honest and reputable company. We have received Dunn & Bradstreet's highest rating and have been in business for over a decade. Furthermore, as any businessperson knows, you only stay in business that long by selling quality merchandise at competitive prices and treating customers right.

Yeah, But when you get your receipt, it says, "ALL SALES ARE FINAL" Why? Because Tony knows if he get's the radio back, He can't sent it back. Why? Because it's a refurbished radio and those have NO WARRANTY!

> FACT: Once people buy from us, they usually come back to buy from us again and again! You can only build the kind of repeat business we have by treating people right!

Yeah? Well explain why you sold a radio to a very good friend of mine and the channel selector locked on Channel 19 and YOU REFUSED to take the radio back? Explain that one!

> FACT: We offer everyday discount prices, but if you happen to find a
> lower
> price, simply call us Toll-Free at 1-888-282-1313 and we'll do our best
> to
> beat it!

Yeah, right. I can undersell you everyday of the week.

I am trying to say that the HAM operators are a MAJOR part of the
problem!

I'm saying that if they are not directly transmitting on the 11 meter
band, they are somehow involved behind the scenes with the illegal sales
of linear amplifiers, or the modification of export and HAM radios for
use on 11 meters.....

Follow the money trail and I'll bet you find a HAM operator!

I never brought any of this up until those holier-than-thou HAM
operators started blasting all those ILLEGAL operators on the CB band
and insisting that they (the HAMS) were part of the solution and not
part of the problem!

>
> Dennis:

There's more than one way that a HAM can be a nuisance on the CB
frequency.

There is the direct nuisance, and the indirect nuisance...

> Consider this though: hams, by virtue of the fact that thier
> identities and locations are a matter of federal record are a bit easier to
> "bust".

Only if you assume that they will IDENTIFY their stations while being a
nuisance...

NOT LIKELY!

> federal resources to do so -- for example,

I disagree.

> the problem operator you said that
> you tried unsuccessfully to bring to justice. Was he a ham?

Someone told me that he is, or was, but I have no proof of that.

I do know he has ham gear, arrl license manuals, etc... on the premise.

Thanks for giving me permission to pull up your posts for the past year. I would not have done so unless you suggested it. I only looked as far as the past month or so.

Most of your posts deal with RF. My assumption that you have given advice on how to mod radios to get extra channels was wrong. For that, I apologize.

I see by your posts that you specialize in RF amplifiers.

I'm reading one right now where you advise a fellow looking to build a 1000W illegal 11 meter mobile transmitter to opt for a 600W illegal transmitter instead. In it, you specifically recommend that he drive the illegal amp with an illegally modified ham transceiver.

It's pretty embarrassing. I won't post it here unless you demand I do.

Dennis. If you have his full name it is easy to cross search the online FCC database. If you have his name you can find out if he's licensed and what his call letters are in a second. Go to:

http://www.tarc.org/hamradio/callook.htm

Or post or email his name to me, and I can do it for you.

I'm offended by your attempt to remame the Citizen's Band by referring
to it as the Illegal Band!

That is the type of attitude that really puts me, and most CBer's, into
the 'defensive' mode!

And that is not at all conducive to solving the problem...

> - It is not legal to sell a radio that has 11 meter transmit capability.

Where does he say TRANSMIT?

I believe it specifically states MAY NOT TRANSMIT!

I would have thought someone like you would be capable of reading a
little more thoroughly and accurately!

> But are you telling me it's illegal to sell
> these things?

As long as they can't transmit they are probably legal.

And a HAM operator could legally purchase one and use it on 10 meter
band for both transmit and receive.

But neither the HAM nor the CB operator could legally transmit on the
11 meter band with one because they are not type accepted for that use!

> and to own them?

Anyone can own a receiver...

It's the transmitter part that gets illegal.

> Do you have a cite for this?

Part 97.

> I'm glad we agree. I'm not pro-ham and not anti-CB.

That's not the way you have been coming across on this newsgroup.

> I'm not a ham

You, I, anyone, can own one if the transmit is disabled.

A HAM can own one that can transmit on 10 meters, but it should not be sold with the 11 meter transmit enabled.

If the HAM, the CBer, or anyone else transmits on 11 meters with that non-type accepted radio it would be an illegal act.

If the HAM modifies that radio to enable it to transmit on 11 meters he would have no reason for doing so unless it was for the sole purpose of committing an illegal act.

Is this clear enough?

True.

> Unfortunately these practices are to the detriment of legal
> users, denying them the ability to carry on communications in a legal
> fashion.

Not always true.

The things I post are not to the detriment of ANY users.

> You may retort, "skip and Latin American stations deny
> communications"

They don't deny communications, but they make it next to impossible to
do it legally.

> but further violating the rules and regs only makes it
> that much worse for those who don't violate the rules.

That is probably true, but in some cases it's not.

A good scenario would be those CBers who like to run power and talk out
of band.

The fact that they left the normal band made it better for the legal
users remaining there.

> Instead of
> contending with skip and an overpowered station broadcasting espanol,
> now I have to deal with a five miles ahead of me pushing 100 watts or
> splattering due to a mod performed by most techs I've seen (i.e.,
> incompetent).

The problem is more from the splattering radio than the power.

Radios splatter, linears don't...

If he had a clean radio and amp, you could go up or down one channel and probably not be bothered at all unless you were only a block or two from him, and if he was that close and was ignoring you; you could simply plug his ears with your legal radio until he acknowledged your existance. If he still did not acknowledge you and you were that close, then you had a serious radio or antenna system problem and shouldn't be griping about non-acknowledgement!

> > Nor does it indicate that I am a catalyst for such events.

> everyone else who uses the park. It merely reflects on you in my
> opinion.

Then you better tell all those writers of the murder mysteries that they are contributing to murder, because they explain how someone might commit a murder and not get caught.

Murder is much more serious.

When you can get them to stop writing those books, then I will listen to you a little more seriously!

If I wrote a book about 101 different ways to let a dog crap in the park without getting caught, it would not be illegal, nor would I ever be taken to task for writing it.

There may be people who don't even own a dog who would buy such a book because they would be interested in learning what techniques I would have used to not get caught. They could be interested in the book and yet not have any intention of getting a dog and taking it to crap in your park!

> Finally, another example of your difficult-to-decipher logic which I

I agree with your position. However, leading addicts or illegal CBers
to less harmful practices does not dispense with their responsibility
when they (in their drugged or over-powered and out-of-band stupor)
violate the rights of others. Nuisance, loittering, public
intoxication, and other such unpleasantries remain crimes which the
non-addicts and legal CBers will complain about -- and rightfully so.

>> and when does denying someone access to public
>> property constitute a "minor infraction"?
>
> When you agree to accept that interferrence from other stations as a
>condition of using the band as described in part 95.

Could you quote the relevant section from part 95 which says legal CB
operators agree to accept interference from non-type accepted radios,
or illegal linears? That is what is a crime, and it is what seems
fairly serious in potential penalty. Just because CB operators accept
interference from legal operators does not sweepingly justify or make
minor the illegal acts of IBers (Illegal CBers).

In article <3704FA61.3654D3CF@lucent.com>
"Dennis W. Ostrowski" <dwostrowski@lucent.com> writes:

> I try to talk folks out of illegal mods, noise toys, roger beeps,

>
> You are very close. Remove this text from your last sentence:
>
> 'the prevalent illegal behaviors on CB, and'
>
> And you have it right.

What is it about that clause that you take exception to? Is it that you don't believe illegal behaviors are prevalent on CBRS?

In my area the illegal behaviors are prevalent. I believe those operating illegally are a minority compared to those possessing CB radios. But those operating illegally are operating far more often than everyone else. It is in fact rare to hear someone say they have a type accepted radio and/or not running a "footwarmer".

Or is it that you don't feel crime among the underclass, and illicit drug use, "describe the prevalent illegal behaviors on CB"? The more I think about it, the more I feel it describes illegal CB activities adequately. The criminal and drug user/pusher always have some excuse about why they do what they do. Their mother spanked them too hard in public; they didn't have the "opportunity" others had, etc. Illegal CBers seem to employ similar rationalizations for their practices. IBers (Illegal CBers) can't live with the capabilities of the band, and they demand the "opportunity" that users of other bands have. This injustice of inopportunity becomes the overriding factor in their breaking the law.

Like other criminals, IBers can't work to make changes to the system, or live with the reality of the system. Immediate gratification is required and they will have it even if it is at someone else's expense. At bottom, however, there is always soeone else to blame it on.

I'm a CB'er and it is my concern when IB'ers (Illegal Band) try to
downplay their illegal activities. A possible $10,000 fine and
federal jail time doesn't sound like "speeding" or "jaywalking" to me.

>:No, I'm referring to the act of speeding which you raised as a
>:comparison to illegal CB radio operation. If you don't think they

>:doubt care.
>
>Using an amplifier is like keeping up with traffic.

It is? I've never seen someone step on the gas pedel and run someone
off the road twenty miles away. :) However, I have seen endemic
speeding and illegal amplifier use result in one-size-fits all laws
which penalize everyone for the acts of those who couldn't live by the
rules.

> And I am aware of my
>actions if I am in my car or on the mic. I also know the latter does not
>pose a danger.

Who said "danger"? We have restrictions (speed limits) on our freedom
of travel not only to ensure it is done safely, but to ensure everyone
can travel in a reasonable and orderly manner. The CBRS rules are
much the same. When you key illegal power and disrupt legal users you
can't hear, you've effectively run someone off the road twenty miles
from where you exceeded the speed limit. My point isn't the physical
harm which comes with running someone off the road -- it would be the
denial of their right to travel just because you perceive your needs
to be more pressing than someone elses.

The reason speeding and illegal CB use doesn't compare well for me is
that speeding doesn't result in such unobservable consequences to
others. To me, throwing your trash out the car window would be a
better example. You don't see it, but others have to.

The only way speeding and illegal CB radio operation seem to be
similar is that, as more people rationalize their irresponsibility,
the more reason we have for more intrusive government (photo radar,
speed bumps, Brady bill, EBay ban, etc.).

>:>What about the death, injury and damage to the other persons property?
>:>Illegal CB use poses none of those.
>:
>:You're the one who made the comparison. What about it?
>
>Like I said before there are more serious problems in this country that need
>enforcement and CB radio just doesn't or shouldn't rank high on the list.

Unfortunately all criminals can point to some "worse" crime that
should be fixed before they become the object of enforcement. It is
the nature of criminals.

You haven't been reading have you? If you had, you would be able to answer your own question. I've said numerous times that I am not a ham; neither am I am an IB'er (Illegal Band). I am a CB'er who feels he has no other choice but to look to ARS due to widespread irresponsible and illegal practices among IB'ers operating on CBRS.

>... You automaticly assume we're bad people because we're
>(cb'ers)

I've only been talking about those who engage in illegal activities and degrade CB for the legal operators. All I've seen from the illegal operators is, "we're not so bad; define what the word 'is' is."

>CB'ER by choice I'll se ya

I'm a CB'er by choice, not an IB'er.

Just as we have a right to share a public resource, I have a right to share the airwaves. Turning off my radio due to your _illegal_ behavior couched as "freedom of speech and religion" is not an option -- just as putting earplugs in my ears when you broadcast from a loudspeaker from your roof is not an option.

There's really no excuse for rampant illegal CB practices. The only possible excuse I could begin to entertain is if the government defaulted on the rules, thereby effectively proving there are no rules. I have a difficult time believing this is the case because, 1) we've just seen an IBer (Illegal CBer) get busted in Texas. 2) The primary champions of the "FCC capitulation theory" seem stunningly absent of any referential evidence which could be used to defend illegal practices. These champions likely point to the rampant proliferation of IBers and illegal practices -- but the fact that CB is dominated by illegal practices and the crooks don't turn themselves in is hardly proof that FCC has actively capitulated.

The best way to justify the rampant illegal CB practices would be to work a real complaint. Unfortunately I don't think many illegal CB operators are anxious to do this because they don't want to *really* find out. It's easier to wave around a story about something that once happened, which doesn't appear to have been pursued, and can't be pursued today except in terms of "so-and-so on the Internet said...".

I've already posited my views on this already. See

The irresponsible just couldn't respect the usual speed limit.
Now that street has speed-humps and all of us, including those
who always respected the speed limit on that street have to
slow down below the speed limit and endure a few jolts. Then
there's photo-radar, Brady bill, banning of dogs in the park,
and now eBay and linear amplifiers.

I'm sure everyone involved in each of these said "don't sweat
the small stuff." It's one size fits all. As expected it's
always the size that fits the most irresponsible. From the
pervasive and accepted illegal activities on CBRS, I wouldn't
be surprised to see some further dumbing down of America.
[Message-ID: <36fe1ace.350854@news.primenet.com>]

when irresponsible people ignore the rules they create the
environment for larger and ever more intrusive government. In
many areas, due to increased speeding and red-light runnings,
photo-radar is being implemented. When people drink and drive
we get road-blocks. We've already seen what happens when CB
operators thumb their nose at the rules of their service.

When you face $10,000 fines (or even prison time[1]) for transmitting
illegally, it sure doesn't look that much different. Maybe it would
feel different when I'm out $10,000 or sitting in jail.

>>shooting firearms randomly into the

>
>A little harsh, don't ya think

Why's that? it seems almost exactly the same to me. Indiscriminate
discharging of firearms, just because "I have a right" is a practice
best described as disordered liberty and has the result of denying
others their ability to exercise their rights (say freedom of travel
as bullets randomly drop out of the sky). It's not to say you might
not accidently fire a gun into the air, or that a legally operating
CBer wouldn't step on another operator. It's whether we try to
minimize such instances by adhering to rules which are designed to
promote everyone's orderly freedom. All I see from illegal operators
of CB is "it's not that bad, everyone else is doing it, there's worse
things in the world." In the end, however, you are showing contempt
for your radio service and the legitimate operators of that service.

>>I've yet to understand why these practices are something to be proud

I don't advocate illegal activities, but then again I don't always try
to stifle them either.

I advocate good design, because it makes things better for everyone.

> You actually believe this?

Yes.

> You help, and offer help many times
> to illegal CB activity.

I offer help to make some illegal and dirty devices run more cleanly.

They are still illegal but at least they are running more cleanly and
not generating as much interference for everyone.

I did not help anyone build that illegal amp nor did I sell it, but if
I can help someone make it run more 'cleanly' by offering technical
assistance, why is that wrong?

> > I believe I have made all the bands better because of what I have
> > posted to this newsgroup.
>
> Maybe you could do more.

I'm catching enough flack for what I have already done!

Where is my incentive to get more involved?

More persecution by you and Mark and HAM's INC.?

> There you go again with the, blame it on the HAMs.

Because it's mostly their fault.

> When we each
> have cleaned up ourselves, only then should we clean up others.

So what are you doing to fix it?

As I said, the HAMS should clean their own house first!

> > How about when you talk to your sideband buddies running export radios,
> > or modified radios.
>
> I no longer do this. I have stopped being part of the problem.

But you admit you were a part of the problem until you got 'religion'.

And now you went to HAM.

Maybe there are other newbie CB operators that will take the same route, but if they don't get to follow the same path you did; illegal activities and all; they may get quickly disenchanted and not even stay with the radio hobby, much less become HAM operators.

> Now I'm searching for a solution, that won't penalize the
> decent operator, that has to break the rules, just to get by.
> This is one hell of a dilemma.

I agree.

If you find a solution that is good (and fair) for all, and has a possibility of being accepted by the existing CB and HAM communities, let me know and I will help you champion that cause!

> My radios are legal, and I use them legally.

If you have a non-type-accepted HAM transceiver and it has it's 11 meter transmit enabled you are illegal.

> > Even if you have a type accepted CB radio but also have a linear
> > capable of operation on 11 meters at the same premise, then why
> > shouldn't the FCC make the assumption that you use it?
>
> You're not going to like this. Simply because I have a license
> that allows me to possess an amp capable of working on 10m.

Do you have a license that allows that much power on AM?

And I believe that if you read part 97 concerning HF amplifiers you will find that there are other requirements that must be met for that HF linear amplifier to be legal for HAM RADIO use (unless you built it yourself).

> Just for factory manufacturing, and selling. I can own, and
> modify it to work on 10m.

For 10 meters yes, but it should still have the traps in it to restrict operation on 11 meters, or you have to submit it for wither type acceptance, grant of waiver, or have scratch built it yourself.

And only one a year!

> > If you have an old SB-220 at the same premise as a CB radio it is
> > ILLEGAL!
>
> Nope! Once I obtained the license, it was no longer illegal to
> possess it.

If you purchased that amplifier after April 28th, 1978, and cam with 10 meter capability in it, the shop you bought it from sold it to you illegally.

If you purchased it prior to that date, you are correct.

> Looks like you need to go back, and read it a little closer.

I did.

See above....

> >
> > So those hams with a CB set and an SB-220 at the same premise are all
> > illegal!
>
> Nope!
>
> > Any HAM running an export radio modified to run on 11 meters is illegal

> > first place, and no one can legally run a non-type-accepted radio on the
> > CB band, HAM LICENSE or not...
>
> This is partially correct. He can use it on the Amateur bands.

That transceiver could not be legally sold as a ham transceiver with 11 meter transmit enabled; even as a 10 meter ham transmitter.

To get 11 meter transmit capability the HAM would have to modify the legal radio after he purchased it.

As so as he enabled 11 meter transmit in that non type accepted radio I would become an illegal radio because NO ONE COULD LEGALLY TRANSMIT ON IT ON 11 METERS! And it could no longer legally be sold (marketed), even to another HAM!

> This is not the way it works. The rules are slightly different
> as to equipment for HAMS v CBers. Mere possession of a radio,
> by an Amateur, that will tx on CB is not illegal. Using it to
> do so, is.

Then someone had better change those rules because the way I read the rules it would be illegal for any transceiver to be marketed (sold) with transmit enabled on the 11 meter band.

Since A HAM cannot legally transmit on the 11 meter band with that radio, the only possible reason he could have for modifying the radio to enable the 11 meter transmit, would be to illegally transmit on 11 meters!

It would also require a request for type acceptance or a grant of waver from the FCC to have such a modified amplifier legally in your possession.

> I'm not for calling anyone, and turning them in. I really wish
> we could work this out without intervention by the g'ment.

I do too.

But I will continue to rebuke any posts I see made by HAM operators putting down CB operators on a CB newsgroup!

Let them post the on a HAM newsgroup and I could care less, but doing what they are doing on a CB newsgroup is just stirring the trouble pot.

And as you said, it will only end up hurting everyone!

> I'm in real trouble with the whole thing. As a CBer, and an
> Amateur, I catch it from both sides.

Your (our) posts here have been part of the problem.

If you don't want the post stirred; don't hand me the spoon!

Stunning. Although I have a different posting on the topic, we're now
back to you telling us what we already knew after asserting that
possession and sale were illegal.

Really? I thought you wanted the alleged retard near you to suffer
some kind of penalty if only to have his equipment siezed. Now all of
a sudden you're anti-penalty. Or, did you mean only penalties *you*
agree with and for problems that affect *you*? <wink>

How does this work? Dennis has asserted 11m xmit equipment itself is illegal (although he seems to be back-peddling as of late). You mention the amplifier law. If an export radio is not type accepted (which it isn't) and xmits above the legal limit, is it considered governed by the amplifier law?

>
> Is this clear enough?

Actually it's not. What you say above don't harmonize too well
together (some seem mutually exclusive). This is particularly
disturbing when you had written strong assertions that the possession
or sale of 11m radios were verboten:

"I think someone should call E-Bay and let them know that it
is illegal to sell a ham transciever that has transmit
capabilities on the 11 meter band because it is not
TYPE-ACCEPTED"
Message-ID: <37040160.8A022699@lucent.com>

"It is not legal to sell a radio that has 11 meter transmit
capability."
Message-ID: <3703F49B.2698AF3F@lucent.com>

"illegal sales of linear amplifiers"
Message-ID: <37051EC9.DE939C52@lucent.com>

Let that 100% legal operator throw the first stone; but I want
permission to check his station to make sure it is totally and
completely legal.
You would be surprised how many might think they are but are

not...
[such as?]
Any HAM transceiver with the 11 meter band transmit enabled in
it.
Message-ID: <3703050B.1F3D63EF@lucent.com>

We went from assertions that a transmit-enabled non-type accepted
radio is "illegal" to possess or sell, to what appears to be a
superflous assertion that actually transmitting is illegal.

On top of this, a FCC warning was posted and it was asserted that this
proved such radios, when used for receive-only <wink> are legal. See
Message-ID: <3706d0c1.4246021@beta1.newscene.com>

Then, in Message-ID: <370526BC.3691B3A0@lucent.com> you say "[a]s long
as they can't transmit they are probably legal."

The only reason this disturbs be a wee bit is that I asked you for
your reference and received "do your own research" [Message-ID:
<37042161.C1C6D389@lucent.com>]

If your assertions are true, I'd sincerely like to know where this is
drawn from.

One possible problem is that power supplies are usually rated in peak short term amps and not in a more realistic (no pun intended) overall use. You may need a larger power supply (4.5 - 7 amps)

Next is the possibility that your swr's are too high (standing wave ratio) You may need to check and set them.

Also did you get a base antenna or a mobile whip. Most times a mobile whip wont work very well at a base location and typically you wont be able to get your swr's down (may burn out your finals)
Hope this has been a help. Sparky at the repair depot

> realized you're a moron. Hand it over."

Actually it would go more like this:

FCC guy: "what are you doing with this linear?"

Dennis the Good guy: "It's in for repair, see the ticket on it?"

FCC guy: "Do you have the proper license to do this kind of work?"

Dennis the good guy: " Yes sir, it's on the wall over there for
everyone to see."

FCC guy, after examining the license: " Is this linear capable of
operating on 11 meters?"

Dennis the good guy: "Yes sir."

FCC guy: "will this linear be used illegally after you repair it?"

Dennis the good guy: "I have no way of knowing that."

FCC guy: " Can you be reasonably certain that this linear will be used
legally after you repair it?"

Dennis the good guy: "Well it did come from a CB shop, but the owner
and technician both have HAM licenses."

FCC guy: " That doesn't answer my question."

Dennis the good guy: "That may be true, but since they are licensed HAM
operators and I am a licensed to repair this type of equipment, they
could take me to court if I refused to accept their business, and any
additional information I could supply would be purely speculation."

"Why are you here again anyway; did someone send in a complaint?"

FCC guy: " Yah...; some legal - beagle named Mark something or other; you are just one on a list of about 3,652 names that he gave us, along with an ultimatum stating that we had to respond within 45 days or face a senate subcommittee for noncompliance.."

Dennis the good guy: "I know him; that's the guy who blames skip and other interference for his not being able to talk to anyone on any of his radios. I wonder when he is going to figure out that it's just because no one wants to talk to him?"

FCC guy: " That's him all right; a real loser! But we have a team watching him round the clock now waiting for him to make a mistake like not identifying his station every 10 minutes; and when he makes that mistake we will give him one of those court mandated 10X sentences he forced us to start handing out to everyone. That's the one where he will lose his house and car and all civil liberties for the rest of his life!"

Dennis the good guy: " Couldn't happen to a nicer guy.....", "How about a beer?"

Fcc guy: " I'm off duty in 5 minutes anyway, why not?"

Dennis the good guy: " Let's got to Big blue's place; I'll buy the first round."

FCC guy: " OK, but this time you rack and I get to break!"

Dennis the good guy: "You're on!", "Let's go!"

And they march away into the sunset, as good friends, united by the threat of their common enemy!

Dennis

The same applies to HAM TRANSCIEVERS modified to transmit on 11 meters.

There is no provision for them to ever be used legally!

Go to court and either get them to sanction the linear or make it
illegal to have in your possession any HAM TRANSCIEVER that has it's
transmit enabled on 11 meters!

> Wrong. Just as the CB operator's creed is "it's not illegal if you
> don't get caught",

That is also the creed of the HAM operator transmitting on his Kenwood on 11 meters, the speeder going to work, the scanner owner listening to cellular conversations, the store operator with the video cameras in the changing rooms, and the guy carring a pistol for his own protection in the city of Chicago.

> the government's creed is "you can make charges
> stick with fabricated evidence or a helpful judge."

Now you are showing us the government's, and your own, true colors!

> Of course, you guys will cry like babies that the government doesn't
> follow the rules. Huh, what's up with that?

Sounds like you condone making up rules just to suit your own agenda!

But isn't that exactly what your complaint was with the CB operators?

Sorry, but it is not!

Not only does it take a quite expensive unit, but it must be frequently calibrated.

And if the calibration date and the serial number of the measurement device that was used are not present on any complaint received, you should question why.

Why not?

Those regs make those things he likes to do illegally, legal!

> We don't need nor want any more law breakers in the ARS;

They you better start cleaning you own house first, and you have a very
long way to go yet!

Don't matter which comes first, both houses need some cleaning.

That doesn't make your posting any less out-of-line though, does it?

You are doing exactly what you accuse the CB radio operators of!

Sounds like the typical troublemaker the FCC has been busting lately.

Extra Class Ham with his linear tuned to CB channel #55

Good example to follow!

> dealer, and LIED about my purpose for purchasing the radio.

So he, a HAM operator, illegally sold you a HAM transciever capable of transmitting on the CB band, without ever verifying that you had a valid HAM license!

Don't feel bad about it, this goes on dozens of times a day, 5 or 6 days a week, across the USA.

Follow the money trail, find the source of the problem!

Mark , this same phenomenon of running someone of the road as you call it can be achieved , running legal power and a regular antenna or perhaps a thing called" propagation" which the government has yet been able to control, you know like when skip rolls in and you cannot hear the locals over the dx. Or how about on the ham bands where Joe "Extra Class" has a legal limit + station , Alpha 76 Amplifier on stand-by , piped into a Force12 beam, waiting for a VK station to clear, so he can bust thru the qrm he fires that big Alpha legal limit plus on your little old 200 watt station, no one even knows your there , let alone him and he just keyed on you denying your right to the airwaves , denying your travel as you call it . Most people who get on a highway get on with the fact that there may be someone coming down the road faster than they are, so they stay to the right and still travel the road , most people who use the cb know there are other people running power , there will be skip conditions they cannot do a thing about . if 11 meters were a valuable spectrum the goverment would have sold it long ago, It is not a stable band . Talking on the cb with a few extra watts never killed anyone that I know of , it is a hobby for most and it keeps people "off the streets", doing other unwise things , some people are bored or lonely and talking is a good thing for them . I feel that if it doesnt interfere with a neighbor or an emergency something along those lines , let the people do it, Most are good old working people who come home and want to shoot the shit after a long hard day, but you want to fine them $10,000 and put them in jail. Hardly a crime doesnt fit the time case. Anyhow you will come back with some rhetoric you lawyer type are all the same .

>much the same. When you key illegal power and disrupt legal users you

Sometimes the mod gives you both. Just don't transmit.

> I'm curious how you arrived at your "transmit-only"
>prohibition?

It is a violation of the Commission's regulations to:

(1) import or market a transmitter that is designed or intended to operate on frequencies outside of the ARS bands, if it has not been issued a grant of equipment authorization for the radio servce(s) in which the transmitter is capable of operating;

******* Import or market.......a user does neither ************

(2) import, market or operate a transmitter that requires a grant of equipment authorization but for which no grant has been issued: or,

******* operate a transmitter , I've always said don't transmit ******

(3) transmit on a frequency allocated to a licensed radio service without the appropriate Commission issued station license.

***************** again don't transmit *****************

That's pretty much correct.

What part of my statement was so hard to understand?

> I've already said that I don't care what the legal power limit is: the
> problem is that illegal power users make it worse for legal power
> users than vice versa.

Everything is relative.

If you have a legally powered base station and I have a legally powered
base station, and we both have beam antennas pointed at each other, it
would take one heck of a lot of illegal power to interfere with oou
conversation unless that illegal power was located somewhere between us.

If that did happen that the illegal power was between us, we could
affect his receive just as much as he was affecting ours, and he would
become quite unconfortable with that situation (unless he was there
exclusively to jam our communications) and want to find another clear
channel just as much as we would have wanted him to.

>- > Rules, like contracts, can work both ways...

Yes.

The lawyers!

> > Can you prove it?
>
> What was the incident in this thread which you responded to?

The one where you got stepped on.

> even further.

True.

> > Remember, those truckers were completely legal based on the current
> >part 95 rules!!!!
>
> Even though they said they were using Galaxy 99s?

No, but in my scenario they were using stock radios, remember?

I was just trying to point out the fact that it does not make that much
of a difference if they run a hot stock Uniden, or a export Galaxy
radio....

They will still plug your ears!

> That's the problem, nobody decides. We end up with blanket laws which
> impact everyone including the legal users. Look at what happened at
> Ebay.

That was expected!

Look at the ones who were cross posting to advertise their stuff on
e-bay

They had HAM callsigns at the bottoms of their posts.

My guess is that someone got tired of the spamming and knew what they
could do to make it stop!

That's fine with me!

> How can the problem be the same when they run 4w compared to 15w?

Because if the square of the power VS distance law.

The difference in range between those two power levels would not be
that great!

> > A few truckers traveling together using stock radios can go a heck of a

>
> <chuckle> Following your rules we'll never be able to agree on
> anything because you need a fingerprint.

No that's not true.

My problem with some of your statements is that it would require expert opinion to even be correct half the time on some of the assumptions you have made, and I don't believe you have enough experience yet to be able to do that.

> >and last but not
> >least, you don't know if it was a licensed ham on 11 meters or an
> >unlicensed CB operator.
>
> What would that have to do with it beyond satiating your need to prove
> that some hams are active IBers? (Illegal Band). In the end, someone

> two legal users he couldn't hear thereby denying service to legal
> users.

It would have everything to do with it because if the radio that he said keyed on him was not an illegal one, he would not have a leg to stand on, because of the 'acceptance of interferrence' clause that goes with part 95!

> I have no idea if he was "justified" in doing so because he
> needed to talk further than the legal limit would allow.

You are making assumptions that he was using illegal power levels but
cannot prove it.

> Only that
> had we been running the same power he would have been more likely to
> have heard us and either waited, QSYd, or called break.

You are assuming he had his radio unsquelched!

I wish they would make it illegal for a radio to have a squelch control
for exactly that reason!

> > It could have legally been a HAM rag chewing on 10 meters and you were
> >receiving a spur or a heterodyne down conversion caused by a strong
> >local signal on another frequency.
>
> That could be, but I didn't hear a call sign.

Were you listening for at least 10 minutes?

> > Guilty by your innuendoes again, huh?
>
> No, simply pointing out that your old tired saw about this event the
> FCC didn't deal with didn't seem very important if you didn't keep
> copies, get certified receipts, and escalate. <yawn>

It wasn't.

That man had no impact on me.

But he destroys the communications in a 15 mile radius from where he
lives in Westmont, Il..

I didn't believe the local storys about the lack of FCC action, so I
took it upon myself to try to do something, and I was also ignored...

> Get me the complaint number or something other than "so-and-so said"
> which I can work with and pursue. I will if you'll just get it.

I'll see what I can do.

> > What options would you propose that would not fall into any of those
> >broader categories?
>
> Escalate?

to who?

When I got no answer from the local office and one day the call was
transferred to the main office, wherever that is, I thought I would have
better luck; I didn't!

> > I say you should identify 'THEY' and find out if 'THEY' are really who
> >you think they are...

>
> I refer to them as IBers. Illegal Band.

And I think that is an unnecessary put down.

> I don't think it's good to
> refer to all CBers as "they" since they clearly aren't all engaging in
> illegal practices.

So you call them all IBers?

It sounds like you are calling all CBrs, IBrs.....

> Would you like to use the same specific
> descriptions in referring to hams? :)

No, because it only tends to confuse the issue even more.

> I responded to your non sequitur, and you respond with a non sequitur.
> Lovely.

Thank you!

> I'm still not convinced the FCC can't do something. Hopefully we will
> be testing this soon.

I won't hold my breath if it's ok with you.

Sorry, but I can never tell if you are being sarcastic or straight...

I got it from a hard copy of the rules and regulations part 97, but you
should be able to do a search on an FCC web site somewhere and find it.

When the HAMS lost the 11 meter band.

Some time in 1978?

NOT!

Wrong type of TYPE ACCEPTANCE!

NO HAM TRANSCIEVER IS TYPE ACCEPTED fOR TRANSMITTING USE ON 11 METERS!

It can't be type accepted because it's input power to the final is to
high and there is no way to limit the power output to 4 watts!

> You may be referring to the famous Amplifier Law.

I have at times, but this is different!

> Q. What does Type Acceptance mean?
> A. Type acceptance is an equipment authorization granted by the FCC. It is

The keywords here are will be used in the proper manner of service for
which it has been accepted!

they are not type accepted for use on 11 meters!

> K5PF
> "No agenda. Just accurate information."

And I just tried to make your information a little more accurate!

Close.

Modifying your own radio for recieve ONLY on 11 meters is legal

Modifying it to transmit on 11 meters is illegal since it would be an
illegal act to transmit on it!

Modifying is different than operating. A 767 comes with an emergency
switch inside. This is not illegal. The info came straight from the
horses mouth. Charlie horse.

How are you going to 'drop the hammer' on him if he only transmoits and
never listens?

Think about it!

You will only be helping him JAM the frequency!

Yes, the modification is in preperation for the illegal act!

Well Charlie better get a new horse!

If the HAMS can get away with that, then how can the guy be busted for
the broadband (10 thru 80 meter) amp?

It just don't make any sense to me!

Unless they had previously agreed to accept all that stuff that was violating their rights as a requirement to do something else they wanted to do.

> Could you quote the relevant section from part 95 which says legal CB
> operators agree to accept interference from non-type accepted radios,
> or illegal linears?

No.

It doesn't use those words, it says interference from ALL sources.

> That is what is a crime, and it is what seems
> fairly serious in potential penalty.

It is not a crime.

> Just because CB operators accept
> interference from legal operators does not sweepingly justify or make
> minor the illegal acts of IBers (Illegal CBers).

No.

They have agreed to accept interference from ANY source!

That's pretty all encompassing!

> I noticed you said illegal "dirty linears." Do you try to talk folks
> out of illegal "clean linears"?

Not usually.

If they are going to buy one I would rather have them buy a clean one.

> > You are very close. Remove this text from your last sentence:

> >
> > And you have it right.
>

> What is it about that clause that you take exception to? Is it that
> you don't believe illegal behaviors are prevalent on CBRS?

No that's not it at all..

Remove the words I specified and concatenate what remains and read it
again.

Then you will understand.

> In my area the illegal behaviors are prevalent. I believe those
> operating illegally are a minority compared to those possessing CB
> radios. But those operating illegally are operating far more often
> than everyone else. It is in fact rare to hear someone say they have
> a type accepted radio and/or not running a "footwarmer".

But that doesn't have any relevance since we got to this point only
because you misunderstood the prior sentence and the meaning of it.

And that was because you didn't follow my instructions to remove those
words.

Instead of removing them, you concentrated on them!

And spun off on an irrelevant tangent again!

Try it again and see if you can do it any better this time!

Oh he's full of it..... He knows nothing about C.B.s,
nor does he no anything other than what he can read on
the web about rules and regulations.
All he is some whining individual from Phoenix Arizona,
that's pissed off because his neighbors radios bleeding
all over him and the F.C.C. won't do anything about it.
I say let him get his Ham ticket, maybe it will get
him out of our hair for a while.

It specifically says "operate a transmitter" If you don't key up you are not operating a transmitter.

>In the case of a non-ham, they would have no possible place to operate

>which was a frequency they excluded from type-accepted requirements.

The key word in everything is transmit. A modification done by
lowering a rapidly moving hammer onto the radio would be a mod,
and according to you it would be illegal. It is not. The only thing
that is illegal concerning mods is using that mod to transmit.
Potential transmit and transmit are not the same.

>Finally, I think there's a great deal of reason to consider this

>
> It's pretty embarrassing. I won't post it here unless you demand I do.

I think you need to, because I believe you are tainting the words to
suit your purpose.

If you do post it, please post it complete and unabridged, and also
post all the other posts in that thread so that everyone here can judge
for themselves!

I am not ashamed of any posts I have ever made relative to amplifiers.

Even if your 'interpretation' of what was said was true, and I was able
to convince someone to use a 600 watt amp instead of a 1000 watt amp., I
have improved things for everyone. Because if I hadn't gotten involved
that man still would have purchased an amp, but it would have been a
much more powerful one and a much dirtier one!

You are just reinforcing my position, and when you feel you have read
enough of my posts to prove that fact to yourself, I hope you will once
again be big enough to admit you were wrong and post another apology
here on this newsgroup!

Have a good weekend!

Dennis

NOT A SINGLE ONE....... Got that, not one. A matter of
fact, I'm going to put a down on the 2003 Harley Davidson
Fatboy 100th anniversary Edition I'll give the baby the
Honda when I'm done....
Also the baby room monitor is going to have a Davemade
amp hooked up to it so I can hear if anything is wrong
from most anywhere in town.

His name is :

Edgar A. White
136 N. Hudson
Westmont, il.
60559-1626

Does that callbook list have names of 'former' HAM operators also?

Ones who may have LOST their licenses?

I would check that list for his name....

That it is not unique to CBrs to have such a 'creed'.

And a licensed HAM operator is not just another CBer, he is supposed to
know better!

:
:I've already posited my views on this already. See
:
: The irresponsible just couldn't respect the usual speed limit.
: Now that street has speed-humps and all of us, including those
: who always respected the speed limit on that street have to
: slow down below the speed limit and endure a few jolts. Then
: there's photo-radar, Brady bill, banning of dogs in the park,
: and now eBay and linear amplifiers.

Just more bureaucratic rules and laws to make the masses feel better none of
the above solved anything.
:
: I'm sure everyone involved in each of these said "don't sweat
: the small stuff." It's one size fits all. As expected it's
: always the size that fits the most irresponsible. From the
: pervasive and accepted illegal activities on CBRS, I wouldn't
: be surprised to see some further dumbing down of America.
:[Message-ID: <36fe1ace.350854@news.primenet.com>]
:
: when irresponsible people ignore the rules they create the
: environment for larger and ever more intrusive government. In
: many areas, due to increased speeding and red-light runnings,
: photo-radar is being implemented. When people drink and drive
: we get road-blocks. We've already seen what happens when CB
: operators thumb their nose at the rules of their service.

The above are good things if they will help but face it photo radar and road
blocks on all the nations intersections and highways isn't practical or
economical. Policing a couple of million CBRS; not likely so, lets make
some more laws and rules to make some people happy.

Mark, you just don't get. We just don't give a damn about the governments idea of how we should live our lives. Especially one that can allow a whore monger to be its president. Now if we could all just ban together and stop paying taxes until we truly have representation of the people again.

Mark A. Fuller wrote in message <370738f4.82906259@news.primenet.com>...

Been a long time since I have done this so I don't rember the numbers but this is how I figured it out. What you are doing is adding enough coil to the bottom of the 5/8ths to make it look like a 3/4. Given this you know that the wire at most wil be 1/8 wl long or about 4.5 ft. Since it is coiled you know that it will be less than this. you can put the coil in series with the antenna and feedline and keep triming the coil until yo uget a decent match, the best SWR you will get like this is about 1.5:1(not too bad). Ideally you want to ground the bottom end of the coil and then tap the feedpoint up on it at a place that matches 50 ohms. This can be a lot of cut and try. Hope I got ypu into the all park with this

Mark asks an excellent question:
>
>How does this work? Dennis has asserted 11m xmit equipment itself is
>illegal (although he seems to be back-peddling as of late). You
>mention the amplifier law. If an export radio is not type accepted
>(which it isn't) and xmits above the legal limit, is it considered
>governed by the amplifier law?
>
>

The export radio is covered under the CB rules & regs, which dictate that equipment in this radio service must be type-accepted. In addition to power limitations, type acceptance hinges on being able to vary the frequency in a manner other than "channelized" switches. (In CB slang, the radio operator cannot be able to "slide" in order for a radio transmitter to be type accepted).

Export radios are legal on 10 meters. They are not legal on 11 meters because of the lack of type acceptance.

I think the light just went on for me. You say modifying your own radio is legal, but only for recieve. You then jump to "transmitting is illegal." I think this jump isn't sustainable.

The FCC notice says (my numbering):

i Some manufacturers are promoting the sale of conversion kits, or have designed their transceivers such that they can easily be modified by the users...

ii Manufacturers, importers, vendors and users of these transceivers are reminded that transmitters intended for operation on frequencies allocated to any of the FCC authorized radio services listed above, except the ARS, must be type accepted by the Commission for the particular radio service(s) in which they are intended to operate prior to their importation, marketing or use.

iii The Commission considers that the transceivers discussed above are intended to be operated on frequencies where the use of type accepted equipment is required because of the simplicity of modifying them to extend their operating frequency range.

iv It is a violation of the Commission's regulations to: (1) import or market a transmitter that is designed or intended to operate on frequencies outside of the ARS bands, if it has not been issued a grant of equipment authorization for the radio servce(s) in which the transmitter is capable of operating...

v (2) import, market or operate a transmitter that requires a grant of equipment authorization but for which no grant has been issued: or,

vi (3) transmit on a frequency allocated to a licensed radio service without the appropriate Commission issued station license.

What stands out to me is the notice enumerated conversion kits which allow users to modify their radios. It then goes on to "remind manufacturers and users" of the requirement for type acceptance. It

then says it is a violation to import or market a transmitter that is designed to operate in a non-type accepeted range.

Doesn't this more than imply that even user modification is illegal? If a user modifies their radio to another service do they not fall into realm of both user and manufacturer? They are enumerated as a party put on notice, and they are doing what the manufacturer is also put on notice for.

In support of this interpretation, in (v) it says it is illegal to import, market or operate a transmitter that requires type acceptance(?) but which lacks it. It does _not_ say "transmit" on a restricted frequency requiring type acceptance. It simply says "operating a transmitter that requires type-acceptance". The moment the radio is converted to 11m, it requires type-acceptance regardless of what frequency you actually transmit on.

I believe the above point is supported by (vi). This condition of violation seems to be added because, earlier in the notice, FCC spoke of ARS-capable radios not requiring type-acceptance. Had transmission been the issue at stake in (v) the authors seem capable of using the word.

It's also worth noting that Hams don't seem to be exempt from this interpretation. This notice exempts ARS radios from type acceptance, but doesn't exempt hams from the requirement of type acceptance for all other frequencies requiring it.

This was very informative and I think I now understand what Dennis was saying. I'm curious how you arrived at your "transmit-only" prohibition?

Maybe you should take a look at:

Message-ID: <19990322085616.00960.00000018@ng61.aol.com>
staradio77@aol.com wrote:
FCC has regulated the sale of linear amplifiers on eBay. The
auctions are being cancelled and completed taken offline.
According to FCC Rules (Section 95.411) CB Rule 11, "It is
illegal to use any type of Linear Amplifier on 11 meters".

Are you claiming the FCC reportedly regulated the sale of linear
amplifiers because CB operators *never* illegally use them?

Or, how about:

Message-ID: <6KuK2.59$_t4.1476223@elnws01.ce.mediaone.net>
kevski@hotmail.com wrote:
Yup, whoever thought that eBay would just ban "CB" amps...

Someone believed Ebay might ban on "CB amps"? why would that be?
because they are widely used illegally on CB?

Or maybe:

Message-ID: <%NEK2.177$z5.3305757@news1.i1.net>
tempola@i1.net
"these illegal linear amps those $^%*$%$#% CB"ERS are
selling".....Now e-bay won't accept any type of RF amp...

It was asserted that a ham operator uttered those words in order to
get eBay to ban amp sales.

All of a sudden, after hams being blamed for informing on illegal CB
users, you're suddenly taken aback that I would refer to illegal CB
users as playing a part in the recent eBay decision? Did you get
confused or something?

:+> I have a Uniden Washington, stock (cut the limiter once but put it back
:+> because it sounded like crap which I thought it would) and on SSB with a
:+> D104 (10dal head) I only get about 3-4 watts peak speaking very close to
:+> the mike. Anything I can do about this?? thanks!!!!!

Check ALC control [VR11].

When you cut the limiter, what was the SSB wattage then? [12 - 16 watts? Then the ALC VR-11 is the culprit]

Since I don't know what type of meter you were reading this on, only 4 watts does sound low.

Check bias for both Driver and Final.

The process can be a quick check. It's easier than checking mA drive, the TP7 for Final, and TP8 for Driver, require the use of an ammeter, which not everyone has.

Measuring from board ground, not chassis case ground, to base lead, of driver transistor.

Orient the radio, front facing you, component side up. Locate VR9 [Driver bias] and VR8 [Final Bias].

Use a dummy load on the antenna jack at the radio, select LSB mode, mic gain control all the way down, no audio.

Board ground - any metal can for tank coil cases works well.

Driver [C4960] or [C2166], TO-220 case, base lead is [front face of transistor facing you leads down] furthest to the left, 1 st leg on left.

Test probe this lead for positive, and negative to board ground on a DVOM set for 2V reading.

Key up radio [remember no audio and use a dummy load]

Check voltage at this leg. It should be about .6 volts, if not, adjust VR8 [Driver Bias] to read this. There is a sharp cutoff, so adjust it to where the cutoff occurs [CCW], then back the control up until it reads .6 volts [CW].

Do the same for the Final, only adjust VR8. Pinout for the 2SC1969 is the same, leftmost leg [front facing you, leads down] is base.

Set base bias to .6 volts, or for more accurate, .677 volts. This can be verified by checking mA drive on the TP's - both should be between .6 to .7 mA of idle current.

Once these are set, then remove test leads, and using the dummy load, adjust VR11 [ALC] using full mic gain [all the way up] and use the "Ahh-h-h" sound, adjust VR11, watching the meter for full deflection, or rise. Once the highest rise has been obtained, and turning VR11 can't get any more out of it, back the control [VR11] back to the point where the highest wattage reading starts to go back down. This point as about the max you can set VR11 and still have ALC control.

I'm figuring the ALC was set a little too low. If you still have only 4 watts, then the problem can be traced back to TR41 [2SC1419] and or TR42 [2SC945]. If TR41 is bad, replace with a 2SC1012 or a NTE-153, but I prefer the NTE-264 [Darlington PNP].

Hope these ideas help.

:+> radio is legal, but only for recieve. You then jump to "transmitting
:+> is illegal." I think this jump isn't sustainable.
:+>
:+> The FCC notice says (my numbering):

You're forgetting one special point.

Sales of these radios, are covered by warranty.

Once the radios have been modified, the warranty issue can become null and void. Therefore the operator must pay for any and all damages done to the radio, and the subsequent re-alignment and adjustments needed or required to meet the conformity standard the device was originally imported as.

The warranty issue depends on the company honoring it.

Some simply do not offer a warranty if the owner tampers with it.

Some offer to repair the radio, if damages done to the radio are not the fault of the modification, or abuse by the operator.

Some don't even bother acknowledging the fact that the radio was theirs.

These three issues, accumulate to one basic premise.

If the operator decides to modify the radio. Once that is done, the operator then assumes all responsibility for problems with it.

It's the operators responsibility, not the manufacturers.

If the manufacturer offered a warranty, 10 times out of 10, that warranty is voided if the operator did perform mods to the radio. This then places the operator as the fault, not the radios.

Whether the radio was able to perform after these mods were done, is not of consequence. If the radio fails, the operator is responsible, not the maker.

The maker is only responsible for the radio in it's stock form arriving to the operator, or dealer, in the specified condition that allowed it's passage into the hands of either the dealer or the owner.

IF the owner or dealer modified it, the only person that has sole responsiblity, is still, the owner. The owner made the choice, and if applicable, the dealer simply did what was requested.

Amateur ops have more to lose due to this.

Let me put it this way.

I can buy a Chevy Chevette. I then place 4 miles on this brand new vehicle, just to get to "Freds 'furbished FORDS".

I request they remove the 4-L engine, and replace it with a V-6 or a V-8.

Does that mean the dealer I bought the vehicle from is responsible for fixing the vehicle under a bumper-to-bumper 12,000 mile warranty?

They don't.

Why?

They didn't put that engine in there, you did. Any problems from the moment you placed that engine in there, and from then on. They are your problem, no one elses.

It says a lot for both CB'er and Amateur alike.

When it comes to complaints or violations, it's on an individual basis, not an entire group.

Don't lump good CB'ers with Bad ones, then we won't bunch the lot of Amateurs as being bad either.

You can quit with the stereotypes at any time.

That last sentence sums up the point I've been making. We would more
likely hear him and not inadvertantly drown out his communications.
If you and I run illegal power it is more likely we will hear each
other but not the legal users. In the meantime we're creating x times
more QRM. That doesn't mean legal power is always perfect, only that
the imperfections don't justify making the playing field uneven and
thereby even more imperfect for the legal users.

Exactly. I gave that story. You said you didn't like it when it
happened to you. I said it's illegal and you asked if I could prove
it. The guy who stepped on me said he was running a RCI. That's
illegal. If you don't believe the story it would have been easier to
say so initially.

In reality they don't and just because legal power wouldn't be perfect
doesn't mean it wouldn't be better than illegal power. That is to
say, while I agree with you that a dozen trucks bumper-to-bumper
talking 5 watts with their RF gain turned down aren't going to hear
someone 3 miles away -- it is still better than a dozen trucks, half
of which are running 15 watts and bleeding due to poor mods, with
their RF gain turned down and not hearing people 9 miles away who are

running legally but can hear the trucks.

Capice?

Has anyone tried this antenna yet???
Is there anyone who tested it??? I purchased one just to see if it really could get close to holding the 10K they said it could. The other main reason is I thought it would be real good because of it's short length to ride around town mud ducking but, still being able to hold the watts. I bought the 3 foot nightstick.
Well barefoot it tuned up real good but, when I put 400 bird watts in it well the reflection went up to and I believe I burnt it out. Everyone outside of the van could hear me in the parking lot through my antenna and it was real loud. They waved me to come out so I keyed it again while looking at the antenna. It was arching and sparking at the tip of the nightstick and again I could hear my audio as loud as can be. After that I took the antenna down and the metal tip was burnt.
Did I burn the antenna out with 400 watts??? Did I get an inferior antenna?? Any ideas??? It was only 12 dollars so I guess the investment wasn't too bad!!!!
Does anyone out there know of any smaller antennas in the 2-4 foot range that can really handle 400 bird watts???

Thanks,

ICE, ICE & More ICE..... Mr. ICECOLD Big Apple Trees Just hammered down!!!!!

Yes, I agree. Doesn't that pretty much put the kabash on all these CB retailers (whether they're hams or not) who sell "export" and ham rigs modified to transmit on 11m? Wouldn't it also impart some ramification for eBay?

>(2) import, market or operate a transmitter that requires a grant of
>equipment authorization but for which no grant has been issued: or,
>
>******* operate a transmitter , I've always said don't transmit ******

My point was that this one doesn't say "don't transmit on frequencies where type acceptance is required." It says you can't operate the transmitter, period. Doesn't this clearly make ham radios modified to operate on 11m illegal for use on ARS?

In the case of a non-ham, they would have no possible place to operate the transmitter. So #2 doesn't affect them. However, a ham does have other areas to operate and this clause seems to say the xmitter can't be used anywhere.

>(3) transmit on a frequency allocated to a licensed radio service
>without the appropriate Commission issued station license.
>
>***************** again don't transmit *****************

That's what is deleterious to #2. Had they meant "don't transmit" on a specific prohibited frequency they apparently seemed to have the means to say it since they said it in #3 (regarding ARS specifically). It causes one to wonder why they chose "operate a transmitter" in #2 without reference to *any* of the bands they enumerated as problematic for non-type accepted operation. Then they say "transmit on [ARS]" which was a frequency they excluded from type-accepted requirements.

Finally, I think there's a great deal of reason to consider this notice as prohibiting modification of the transmitter by the user regardless of whether they ever operate the transmitter.

The notice clearly concerns "frequency expansion" and addresses "Manufacturers, importers, vendors and users of these transceivers". Why would the FCC prohibit manufacture, import, vending and marketting of non-type accepted radios but not have a problem with users effectively doing what manufacturers, importers and vendors can't?

That wouldn't make a lot of sense. Logically, however, they'd never know unless you're caught transmitting and they'd likely push that angle. But it seems obvious that the intent of the notice is to prevent possession/proliferation of such radios.

However, he keys up his illegal radio and he's welcomed into the
brotherhood of illegal practices. I agree with you that he should
know better and I would support 10x the penalty for hams operating
illegally on CB. But, ultimately it is CB with the illegal practices
and the creed.

Unfortunately that's exactly what seems to happen. I can't think of
to many (if any) instances of increasing disregard for laws (or
non-enforcement of laws, which seems to go hand-in-hand) which didn't
result in less freedom. I could easily see us in a situation where
you have to present your ham ticket to purchase non-cb equipment. Like
the 4473 "yellow" forms for purchasing firearms, some people will
"lie" and when it becomes prevalent enough (in conjunction with
under-enforcement) we'll have mandatory ham-license "instant check".

However absurd this sounds, and however much under-enforcement plays a
role, it always seems to be a losing game.

I agree. What it doesn't say is "operate a transmitter on a frequency where the transmitter must be type accepted." I was under the impression that because hams could modify their radios and ARS didn't have "type accepted" requirements, that a ham could modify a radio for 11m, never transmit on it 11m, and continue to transmit on ARS frequencies.

This FCC notice indicates once a radio needs to be type accepted, it can't be transmitted period. The non-ham would have no other band to xmit on, so this distinction may seem superflous. A ham on the other hand would have a radio which couldn't be xmitted on ARS either.

>Potential transmit and transmit are not the same.

If that were the case then they wouldn't have addressed manufacturers, vendors and marketers. The only one who will transmit, as opposed to potential transmit, is the user. The notice clearly prohibits all types of non-transmit activities prior to the radio reaching the hands of the user.

>Who said they had to be logical. They did not specify users.

The entire notice is about keeping non-type accepted radios out of the hands of users. If I take your reading I would have to believe a user can modify the radio, but would break the law upon selling the radio (marketing, vending). That wouldn't make much sense.

I was pretty much with you until this one. What if the ham wanted to
receive the CB and free bands, and there was no practical way to
enable extended receive without also enabling extended transmit?

Ford makes a fuel pump filter. I don't have the model number (maybe someone on the NG does). You can try www.alldata.com to see of there is a TSB for your car. The TSB listing only goes to the 1998 model year. If you have trouble finding any info, ask Ford service to look up "TSB# 9637 Fuel Pump Buzz/Whine Through Radio Speaker" for a 96 Mustang GT and see if that filter/fix can be applied to your Mercury.
Good Luck,
Steve.

If your sure it's the power supply, there may not be much you can do. The Samlex 1223 is a switching supply. Switching supplies can generate RFI. You could try a filter, locating the radio away from the supply or playing with different grounding combinations.
Steve.

<>>

Dennis,

It's pretty clear to me (from the post below, and similar opinions you have expressed in this newsroup) that you feel that using illegal CB amps on CB frequencies are okay, as long as they are run "cleanly".

If that's your opinion, you should admit to it. Or maybe you have admitted to it already, and I'm just not hearing it.

Nonetheless, it's my right to hold and express an opposite opinion from what (I think) yours is.

My opinion is that - "clean" or not - amps are still illegal - and still cause interference to other CB users - and still contribute to making the band worse for everybody.

Furthermore, it's my opinion that when you (Dennis) advise someone (like blueradio@usa.net) to buy a Texas Star Amp and drive it with a ham transceiver (!), you are indirectly contributing to putting another [illegal] high-power signal on 11 meters that other users will have to contend with.

And perhaps by reading your advice to "blueradio@usa.net", people who have never considered getting an amp might be influenced to acquire a Texas Star [illegal] amp of their own.

Or a newbie who thought all amps were "dirty" now gets the idea that he can run an [illegal] amp -- as long as it's clean.

Please, let's not go down a sidetrack about the vast conspiracy of hams that are at the root of the problems that plague the CB service. Or the fact that there are worse illegalities than the ones we're talking about. I know that hams sell amps to CB'ers and I disapprove of it. And I know that drugs and crime are far worse problems than illegal amplifiers. But those issues are just distractors.

The issue at hand is that a person with your obvious technical expertise is taken seriously in a newsgroup such as this. Because of that, your opinions have consequences, whether you want them to or not. Look, nobody can stop you from expressing your opinions, least of all me, and I would not want to. But what I am asking is that you seriously consider that you may be helping to perpetuate the increasing use of, and resulting problems arising from [illega] amplifiers used on 11 meters.

Joe

What you are looking for doesn't currently exist in the US market.

The Texas Star DX1600 (sweet-16) comes closest to what you are looking
for but it does not provide variable power or output filtering.

It would also need a little more than 4 to 5 watts drive. (although 4
watts should get you a dead key of about 150 watts peaking at 600.....)

Dennis

I believe there are folks on this newsgroup that could help you find a
new one.

> or would i have to go for a used one?

There are some very nice used ones around also...

> Well i can always add the filtering external. not a problem.

External is never as good as internal.

But with a 'clean' amp like the 1600, (as long as you put a clean signal in and don't overdrive it), you should not need much, or any, filtering....

> in the dollar range that i'm talking I could always drive it with a higher
> power radio like an rci29xx keeping me from needing a driver amp.

I would rather see you drive it with a HAM transciever if you want 'clean' operation.

> or run a
> driver amp with variable power.

That doesn't usually work out to be a 'clean' solution; and creates too many additional problems.

The DX1600 does not need all that much drive if you want to keep it running clean.

20 watts in with 100% modulation will probably get you a 400 watt dead key and 1200 to 1600 watts peak depending on the supply voltage you can hold under load.

> Guess I should lower my goals a hair.

Don't lower your goals, they are good ones!

> But i still want to go class ab, run clean,and dead key around 500w.

You will have to find a DX3200 (Silver Bullet/Viking) model if you want a 500 watt dead key with clean peak audio (2000 watts peak or so).

I would start out with a DX1600 and if you need more later, sell it and upgrade.

The Texas Star amps hold their resale value as good as or better than other CB amps.

Since I don't sell any amps myself, you know that I can be completely unbiased with my recommendation...

Have a great weekend!

Dennis

I just happen to have what you are looking for. VR 13 and VR12 are your SSB and AM pots. cut R249 and replace R238 with a 1 meg ohm resistor.....that should just about do it. There is another mod, but it won't get you much more that these mods will. When you replace R238 you may have to run you mike gain lower than previously as it opens up the adio circuit.

73's and have a happy Easter.

I just bought it yesterday it looked pretty good i bought all the stuff for
it so i could use as a base unit i bought a 3amp dc power supply and a smart
cb base antenna i am not getting hardly any range at all i can hardly pick
up anything i got a hand held its a 40 channel Eurosonic and it wouldnt
even get down the road with me speaking to it is it my cb or antenna i live
in the UK if there is anyone with this cb could they please email me and
tell me what kinda a range they get and if they get far what antenna do they
use i fell pretty pissed of paying ?100 for the cb
?30 for power suppy i?10 for coaxil cable and ?20 for the antenna what is
wrong here.
I am new to CB's as you can see please reply thought

If any of you have the Golden Eagle base tube amp, like the one I use to have, that came with the 27lf6 tubes, I have found a place on the web that claims to carry both new and used 27lf6 tubes. The prices they listed were $32.00 for new and $16.00 for used. If you want their web site address, just drop me an email and I will gladly send you the info....I am in no way connected with this company that has the tubes, I just remember how hard they were to find when I had one of those beautiful black boxes.......73.....Tom

Are we missing the forest for the trees? This notice is dated May 13, 1996 and is almost three years old. What was the point of the notice and who was being targeted by this reminder? The first line appears to focus on the "10 Meter" Amateur Radio Service equipment, and the implication of the notice is that this equipment does not meet FCC guidelines. Yet there must not be anything about this equipment that violates any of the regulations or it would seem that the importers would have been stopped. In fact, since that time, Wireless Marketing has copied almost the entire Galaxy line with their Northstar radios, and Cobra introduced the 148F GTL DX+. It has always been the responsibility of the radio operator to use the equipment properly, so was this notice directed at them? Have there been any changes in enforcement since this announcement? The Senate bill intended to give local law enforcement the authority to enforce the CB rules had to be attached to the telephone slamming bill as an amendment, and then died in the House. It seems unrealistic to expect radio operators to take the rules more seriously than the people who wrote them.

A "fine" from the FCC is called a Notice of Apparent Liability (NAL). If it is not paid, the next stop is Federal court, where the FCC presents its case and the judge issues an order for the defendant to pay. It then becomes a judgement against the defendant. If he owns real property, it is a lien which must be satisfied, if and when the property is sold. If he goes to buy a new pick-em-up truck, the judgement shows on his credit report and kills the deal unless it is paid in full.

The judge can reduce the NAL in extreme hardship cases. However, most defendants do not qualify for a reduction. Extreme hardship is difficult to prove.

Bad as all this is, there are two elements which can be even worse:

1. Married individuals. How do you answer when your spouse says, "You never had money for the kid's teeth or to get me out of that junker car I have to drive, but you think we have $5,000 to pay in fines for screwing with those stupid radios and breaking the law!"

2. Unmarried, living at home, with an antenna on the roof or in the back yard. Charges could be brought against the property owner(s)--your parent or parents--on the basis that they control what happens at that address. This is most common when the Government wants to collect expenses (like when the boys out west created fake distress calls and the county billed them for Search and Rescue costs), or when a neighbor has sued that you have prevented the "quiet enjoyment of their property" with your radio activities.

The point being: You probably can run that barefoot RCI-2950 for a long time without being caught. Probably, if you handle things with maturity, you even can run some power.

But, attract the wrong kind of attention and someone will come after you. So, think not only of yourself, but of the other folks--folks who don't have anything to do with CB radio--who can be affected by your actions. Thanks, and best wishes.

K5PF

You know, it really bugs me that a certain few individuals in this ng seem to enjoy nothing better than slamming someone's asking price for equipment. "IF" you can buy it cheaper, then do so! I could care less! In certain area's of the country, when you buy equipment from a shop, you can't always get it for the price you can get it for over the net. So just for instance, let's say that a shop had a "WHIZ-BANG 900" for sale for 250 bucks, and you bought it and decided you liked something else 3 months later. Well, they were selling that same radio over the net for 185 bucks, should you take that loss? In my opinion, not if you don't have to. 225 would be a fair asking price to me provided it was a sound radio, and I wanted that particular item. have a day. Towchain

Message-ID: <5apN2.811$7_6.3788@typhoon01.swbell.net>
Source record: 330

Well, I took my amps out of line and am selling them. Yesterday I turned on my base radio at about 11:30. Nice, sunny day, and I discovered something. My neighbor ACROSS THE STREET could not hear me transmit. I checked my antenna, checked the radio and mike. All were OK. But it is kind of hard to talk with 30db of skip and trash. So, what I have is a Cobra 142 GTL paperweight. That is all that it is good for. Mark, you want us to run legally, and I do too. However, when the results of being legal are what I just described, then what is the point of having the damn radio?

It's pretty clear. Read the FCC Notice at

Message-ID: <3706d0c1.4246021@beta1.newscene.com>

If a ham modifies the radio such that it can xmit on a frequency which
requires type acceptance before transmission, then the radio cannot be
transmitted anywhere on any frequency.

And a mobile or base runnnig power will have more opportunity to do it
and with more strength.

Dennis accused me of doing with my post what I accuse IBers (Illegal
CBers) of doing. However, there was nothing criminal about my post,
nothing that would subject me to a $10,000 fine or confiscation
action, and my posting didn't even potentially prevent other usenet
posters from exercising their right to post.

You talk about someone "hinting" about something and yet all I see are
people hinting at their unwavering support for criminal activities.

>of the notice is that this equipment does not meet FCC guidelines.

The entire body of the notice is about radios which 1) are imported, manufactured, marketed or sold with non-type accepted capability (such as 11m), 2) radios which are easily converted to non-type accepted capability by the user, 3) conversion kits for user installation, 4) unlicensed individuals operating on ARS frequencies where type-acceptance isn't an issue, but licensing is.

>... It seems
>unrealistic to expect radio operators to take the rules more seriously
>than the people who wrote them.

To some degree I agree with this. I don't deny that, with lack of enforcement some people will break the rules. You always have a percentage of society who can't live by rules unless they feel they're being watched. Then others feel it's unfair that others get goodies they don't, and they break the rules. Then others feel they can't operate effectively in competition with the others, so they have to ...

Unfortunately, I've never seen this rational have a long term positive effect. Generally more lawlessness occurs, and then someone will take the laws seriously and you'll have even more laws than you had to begin with. Instead of a few efficienados who dabble in "exotic" goodies, you have the vast majority doing it, and then nobody.

However, the corrolary to your observation is "it seems unrealistic to expect [anyone] to take the radio service more seriously than the people who use it." I'm not sure, at this point it even matters.

One thing to keep in mind is, had FCC put forth the Notice in '96 and immediately begun enforcement, there would have been others who complained that you can't ignore enforcement, let lawlessness abound, and then come in and enforce without *any* warning. I personally feel this is the loser's excuse, but the reality is that many people do operate this way (i.e., blame othes for their misdeeds).

However, if the Notice in '96 was meant to be a notice of intent to enforce, look at the effect it had. Do a search at any search engine for "CB Sales" and see what kind of effect this notice had. Nada.

My point is, it wouldn't have mattered what purpose the Notice was intended to serve. IBers (Illegal CBers) would complain about how its not their fault. I think we can agree that if enforcement began in earnest, there's no reason to believe anyone hadn't been put on notice, right?

Feds: Man Eavesdropped on Police / Agents say he posted cops' info
on Web site

By Hugo Kugiya. STAFF WRITER

The U.S. Secret Service and Nassau County police arrested an
unemployed electronics enthusiast from Kings Park after he intentionally
intercepted communication sent and received by the mobile data terminals
installed in police cruisers, federal agents said.
Keith Knipschild, a former NYNEX employee, was arrested Wednesday in
his home at 29 Amapola Lane for intercepting information and posting
some of it on his Web site, http://www.knip.com, agents said. Police use
mobile data terminals to check for outstanding warrants, review driving
records and to send emergency information they might not want to
broadcast across police scanners, such as details of an ongoing
surveillance or a planned search.
An affidavit from a federal agent found that Knipschild's Web site
had 93 pages of police transmissions from March 12, which included
criminal histories and warrants, motor-vehicle checks, medical
information about victims, and witness statements. Nassau police
confirmed the information was transmitted by police on that day.
Investigators say a confidential source led them to Knipschild, who
could not be reached for comment yesterday.
Federal investigators said three satellite dishes, ranging in size
from 18 inches to 12 feet in diameter, as well as a 40-foot radio tower
were discovered on Knipschild's property. Calls to federal authorities

seeking comment were not returned yesterday. Details about the
disposition of the case were not available.
Federal documents indicate Knipschild's Web site includes
information of interest to electronic enthusiasts, with links to Web
sites about scanners, satellites and dishes, and amateur radio.
Federal investigators said Knipschild used an illegal electronic
device to intercept police communications. In a related case, the Secret
Service have arrested a San Diego couple, Bill and Cindy Cheek, on a New
York warrant charging they sold such illegal devices on the Internet to
intercept police communications. The Secret Service said one of its
undercover agents purchased a device from the Cheeks, who shipped it to
New York. Details were not readily available yesterday.
Mobile data terminals send and receive information by radio
frequencies, which are encoded into a digital or binary format, one that
is not available to the public. Furthermore, these terminals are
password-protected.

Mini8 and RG8x are the same thing!

And his 1600 will do about twice the power your amp will.

And yes, he needs to upgrade. I ran 8X with my 667 and it worked fine (about 900 PEP watts). Went to the sweet sixteen and killed the coax.

If you have a completely flat match (no reactance on the line), you may be able to get away with it for a while, but if your coax is heating up, it points to a non-flat match at the feedpoint of the antenna (I was running a 102" whip at the time, so my match was not totally flat).

Hope that helps

I run a 4 pill into my 7'ft Nightstick from here in New England. I hit Europe, So. California, and occasionally So. America on the lower side of 48. Not bad for $17.99. The only downside to the antenna is that you should try to center load it on the vehicle. I have mine on a ball mount located in the right rear of a Jeep. There are certain spots where Ill lose my ears (if the incoming signal is at a right ascension to the right rear corner of my car). Ask 1200. He's got his center loaded.

It's not ALL emergency, or experimentation. Whatever the FCC
says it is, it is.

> I wasn't referring to HAMS, I was referring to the fact that you waled
> away from CB and I stayed to try to make it better...

You seem to have stayed because you couldn't take Amateur
radio, and for other reasons I'll get to soon.

> There seems to be similar problems everywhere, but when the skip goes
> away those big amplifiers will not stick around too long either...

Most around here don't use the amps for skip. Just to talk,
because everyone else has one.

> So we run away instead of sticking around to try to fix it?

Fixing it should no include advocating "clean amps."

> But if you run a clean and legal station and you consistantly sound
> good and are someone they want to listen to, they will pay attention to
> you, and you will be setting a good example for them to emulate.
> But you can't do it by talking OUT OF BAND!

If you run a clean, legal station, you will not be able to
talk. You will be a "mud duck." You will be told to buy an amp.
And you'll say it's OK as long as it's clean.

> I do that here, but you don't like it when I tell someone how to make
> their amplifier run cleaner... and it doesn't make any sense to me that
> you feel that way, because a clean amplifier causes less harmonic

DUH??? I've seen numerous posts, by you, that state that you
have helped some of the amp builders design, redesign,
troubleshoot, and modify their product. Not just advice here,
but where the device was on your bench. In doing so, you are
helping to produce a product that will, and you know it, be
used illegally.

> but if
> I can help someone make it run more 'cleanly' by offering technical

So as long as a gunsmith does it, it's OK for you to do so?
More, and more, you make my points.

> > It was at one time illegal for you to do so, KNOWING that it
> > was to be used illegally.

> Not true.

> I don't have to ask how the device is going to be used.

Splitting hairs. You don't HAVE to know, but if you DO know,
it's illegal.

> What exactly did he show you?

Something in one of his books that stated that he couldn't
knowingly work on something that was to be used illegally.

> If you have a non-type-accepted HAM transceiver and it has it's 11
> meter transmit enabled you are illegal.

Not so. I can't legally use it on CB, but I can own it.
Show me the rule that says that I, as a HAM cannot own it.

> Do you have a license that allows that much power on AM?

What has the mode got to do with it? It says 1500 watts PEP.

> And I believe that if you read part 97 concerning HF amplifiers you
> will find that there are other requirements that must be met for that HF
> linear amplifier to be legal for HAM RADIO use (unless you built it
> yourself).

And if you read, and comprehend part 97, you'll see that they
tell manufacturers what they can make. The end user is told
where he can operate, and with what restrictions as to power
levels. The Amateur operator is mostly left on his own, as to
WHAT he can own. As long as he confines his operations to his
legal bands, he can mostly own what he wishes.
Don't forget, your should don't count.

> For 10 meters yes, but it should still have the traps in it to restrict
> operation on 11 meters, or you have to submit it for wither type
> acceptance, grant of waiver, or have scratch built it yourself.

Again your should applies here. Once it's in my hands, it's up
to me to operate it as I should. I can modify the thing, as
long as I don't operate it where I'm not supposed to.

> And only one a year!

Of one TYPE. Again, once it's done, I can sell it to another
HAM legally. Purchase from another HAM legally. Sell it back to
a dealer legally, and purchase from a dealer one that has been
modified. As long as it's done among Amateurs, it's legal.

> If you purchased that amplifier after April 28th, 1978, and cam with 10
> meter capability in it, the shop you bought it from sold it to you
> illegally.

You need to read it again. With a license, I can purchase it
legally. From anywhere.

Again, you're wishing.

> That transceiver could not be legally sold as a ham transceiver with 11
> meter transmit enabled; even as a 10 meter ham transmitter.

They don't come with 11m enabled. Some CB tech modified them.

> To get 11 meter transmit capability the HAM would have to modify the
> legal radio after he purchased it.

I still can't find any reference to this. As long as the
licensed Amateur doesn't use it on CB, he can use, and modify
it all he wishes.
You don't understand the Amateur rules, pertaining to equipment
allowed.
We are told where we can operate.
We are told in what modes.
At what power levels.
How much bandwidth each mode is to occupy.
Antenna height restrictions.
As long as we stay within the above guidelines, we can operate
most anything we desire. ANYTHING.
I'm sure you don't like this, but it's true.

> As so as he enabled 11 meter transmit in that non type accepted radio I
> would become an illegal radio because NO ONE COULD LEGALLY TRANSMIT ON
> IT ON 11 METERS! And it could no longer legally be sold (marketed), even
> to another HAM!

WRONG!!!!!!!!!!!

> Then someone had better change those rules because the way I read the
> rules it would be illegal for any transceiver to be marketed (sold) with
> transmit enabled on the 11 meter band.

BY A MANUFACTURER! A DEALER CAN SELL TO AN AMATEUR, USED
EQUIPMENT THAT IS MODIFIED. AS CAN ANOTHER HAM.
This is what is said.

> Since A HAM cannot legally transmit on the 11 meter band with that
> radio, the only possible reason he could have for modifying the radio to
> enable the 11 meter transmit, would be to illegally transmit on 11
> meters!

But as long as he doesn't transmit out of his assigned bands,
and adheres to his other restrictions, he can operate anything
he wishes. The rules tell an Amateur WHERE, not so much WHAT he
can operate with.

> It would also require a request for type acceptance or a grant of waver
> from the FCC to have such a modified amplifier legally in your
> possession.

Again, you're wrong.

> But I will continue to rebuke any posts I see made by HAM operators
> putting down CB operators on a CB newsgroup!

I will refer to legal operators as CBers. Illegal operators are
just that. Illegal operators.

> Your (our) posts here have been part of the problem.

My part of our posts is about to stop. I will continue to give
advice on legal CB operation, and if something happens to come
up pertaining to Amateur radio, and I feel like it, I will
respond. I'll try to confine that to email, unless I deem it of
general interest.

> If you don't want the post stirred; don't hand me the spoon!

I don't mind the pot being stirred, as long as it's done
courteously, and factually.

> HAM operators"?

No. They were people selling CB equipment.If they had been
HAMs, I would have said so.

> So he, a HAM operator, illegally sold you a HAM transciever capable of
> transmitting on the CB band, without ever verifying that you had a valid
> HAM license!

Nope. Why the comprehension trouble?
It was a national dealer, and the rig was new, and would not
operate on 11m. He stated that I needed an Amateur license to
purchase the radio, or state that it was not to be used out of
the Amateur bands. Store policy. I stated it would be a present
to a HAM, and we proceeded with the transaction.

as a rule the more you have in the air the better the ears are. alot of antenna xmit good. in rcve the antenna area is called capture area and the more capture area you have the more signal you will capture. for automobiles dual antennas are usually a waist of money. a single antenna placed in the right spot will do just as good at half the cost. however for a 18 wheeler pulling a refer or dry box dual antennas are the best .

Sorry, KS22101, but you didn't read up on this subject very well. You should read Sec. 95.413 to determine where you have misinformed this individual. You don't need a HAM license to talk to someone 15-20 miles away, totally legal to do with a CB radio.

KS22101 wrote:

>recommends you modify the radio by >cutting D14 audio limiter and

Cutting D14 will give the radio very loud modulation. Once you cut D14 you
will probably not be able to run a pwr mic on it.
If you have never done a tune up I would take it to a "tech" who can do it for
you. You can expect to see 15-18 watts peak on a tuned 510. It is one hell of
a loud little radio once the peak mod has been done.

I have an old favorite saying, used in jest, but useful here----"People who think they know it all are particularly irritating to those of us who do."

1. CB works extremely well at a range up to 20 miles with an adequte antenna.
2. What is 'something called a HAM radio'?
3. Check the dictionary for the meaning of 'permit' and compare to 'license'.
4. Never correct someone when you don't know what you are talking about. You might be accused of being a politician.

Sorry to disappoint you.

>such as your's, it is unavoidable.

Sarcasm......grow up, (you have a delete key also) because you are completely missing the point. Where in the Part 97 Rules and Regulations does it state that a licensed amateur must inform a CBer (or anyone other than a Ham) of the FCC Rules and Policies. No one has deemed Amateurs with an enforcement badge (although most of them think they have one). Jeff Herman doesnt even use a CB radio, nor did he ever contibute to the postings on this group other than to spew forth FCC rules and regs. You guys make me laugh, you are so busy making sure everyone else is following the rules, while at the same time your own hobby is going straight down the toilet.

Just because I own a rifle doesnt mean I should go to the Gun oriented newsgroups and tell those folks how to use one. Mr. Herman is doing just that!

366. alan 9001 Conversion to CB

Hi, in a previous post, someone mentioned that the Alan 9001 10 meter radio, after being converted to CB, was the 'best' buy out there.

What does this conversion entail, ie. how does one go about doing this? From what I read on the Copper page, this radio puts out 100 watts. Is that correct?

Thanks, Dave

Yes, I also have a delete key and believe me when I tell you that I use it alot. Some of the crap here is just too darned funny not to read though. When you drag the amateur issue out, it is nothing more than a red herring. Nobody would say that just because you own a gun, or fish, or cross dress, that you shouldn't be permitted on this newsgroup. Whether CB is operated legally or not is not an amateur issue. Some guys try to make a comparison but there is no comparison. They are two separate services with unique rules. There is no overlap other than rf. I am here because I use CB and I do it legally, and I am old enough to remember when EVERYONE on CB operated legally and behaved like gentlemen. I get very irritated with guys who who choose to break the rules, and I get a huge smile on my face when I read that some jerk has lost a couple hundred bucks when he sends his money to some guy name 'creaper' and rather than getting an amp in the mail, receives a nicely wrapped brick, and then wants the postal inspector to fix it for him. Selective enforcement.

I really don't give a rat's ass about Mr. Herman, but if he wants to post the Part 95 rules, and if someone reads them and as a result becomes a better operator, who has it HURT? The hobby needs a few GOOD operators; it is apparent from listening to 11 meters that there are more bad than good ops. How many guys open the box and read the rules before plugging the radio in? I'm sure I can count them all and not use both hands. By being stressed by having the rules posted, can we all presume that you subscribe to BAD operating practices?

>i just don't no why all you ham boy's go back where you all came from.
>we don't need your remarks or comments or we would ask for them.

I assume (since you again fired the first shot) that YOU are to be allowed to say anything you wish about ham operators, and THEY are not allowed to respond.

I'm impressed that you have been here since 1966. So how could you get so uptight over someone posting the rules for CB?

I have to go along with the other responses. Either you are sore that you don't have a ham license yourself (and in the past you have claimed that's not the case), or you don't want to acknowledge that there ARE rules for the CB radio service.

I've been active on CB since 1962, and I've seen a lot of changes. I don't agree with everything that goes on. But that doesn't keep me from enjoying my radios. I sure don't get bent out of shape when someone posts something in the NG. And I sure as &$^# ain't leaving CB radio just because YOU don't like anyone who holds a ham license.

Operate any kind of gear, in any way that you wish. But don't deny newbie's access to good, accurate information. I suspect you'll still sell as many radios as before, so relax.

>When
>you drag the amateur issue out, it is nothing more than a red herring.

You're absolutely right Gary and the reason why that Herring gets pulled out by myself and others is because there are Hams on this newsgroup that pretend they are interested in CB as a hobby, however if you go back and re-read all of their postings you'll never see any of them contributing to any commentary other than that of illegal amplifiers and poor CB practice which is designed to do nothing but stir H&D. Oh, they'll justify their remarks quite eloquently by reminding everyone of the illegalities they are trying to single handedly correct however they never seem to have any real suggestions. Take a look for yourself and scroll through some of the older postings on this NG.

Ive noticed that Hillbilly Dave, QRM, Yourself and several other vocal Hams have posted to individuals seeking advice on issues which because of your cllective experience with the hobby, you have been in a postion to answer these types of questions. However, there are those who's only motivation is to intentionally ram the rules and regulations down the throats of many in order to correct a small minority. Once done, they assume this pissing match for days on end. I too have fallen victim to these exchanges which I guess is giving someone, somewhere extreme enjoyment.

We all know who these people are. They are either carrying this torch for their own entertainment, or they are sorely confused on what role an Amateur Licensee must assume. This Herring, as you called it, is food for these individuals. Ive been frequenting the alt.amateur.radio. newsgroups for some years now and I cant ever recall a CBer posting to these groups what a Ham should or should not be doing whether legal or not, because if it did happen, the Amateur community would be all over them.

Am I abrasive, obnoxious and rude? The answer is yes. People take me for what Im worth to them, which may be zero, however Im not a hypocrite like those who are here only to stir some shit for their own jollies.

What is the likelihood that some of these nasty amateurs aren't amateurs at all but CBers who just enjoy getting a rise out of you? We all know that at least one or two guys here say they are or used to be hams but have 'unlisted callsigns', and how easy is it to get a lame hotmail.com address? CB, as has been discussed before, just isn't a topic of discussion on the amateur side at all, either on vhf or hf. The only time it comes up on packet cluster is when an intruder shows up on the 10 meter band, and whose fault is that?

>but CBers who just enjoy getting a rise out of you?

Come-on Gary you know as well as I do who these characters are without going to qrz.com. Believe it or not hey really dont get my blood pressure up although it appears by my demeanor that they do. This is my "having a great time" attitude.

>We all know that at least
>one or two guys here say they are or used to be hams but have 'unlisted
>callsigns', and how easy is it to get a lame hotmail.com address?

I agree, but these arent the guys for whom Im speaking about.

>CB, as has
>been discussed before, just isn't a topic of discussion on the amateur side at
>all, either on vhf or hf. The only time it comes up on packet cluster is when
>an intruder shows up on the 10 meter band, and whose fault is that?

The only time I hear CB mentioned on the Ham newsgroups is when someone is referred to as a "Chicken Bander" as an insult or when someone makes a comment that HAM radio has gone down hill since they let in all of those CBers when the FCC passed the No-Code Tech license (ala Kevin Munster or whatever his name is).

This newsgroup never had a problem with Hams (as a matter of fact, their opinions were welcomed) until Mark Fuller started cross posting "linear oriented" CB threads to the amateur newsgroups in an attempt to throw some bait out for other Hams to latch onto and to cause animosity between the two groups (which he was successful). The results of which brought a few self righteous individuals to this group who dont have much to do to entertain themselves.

Mr. Fuller still posts to this group under an assumed name (aol accounts aren't very difficult to hack).

"Just when I thought I was out...THEY PULL ME BACK IN!"
- Al Pacino, in The Godfather

Regarding "who should be allowed to post in
this newsgroup": are we suggesting that only those
who answer technical questions from newbies should
be permitted to express their opinions in rec.radio.cb?

I'm afraid that would bar half the people who frequent
this NG from posting. Not a very democratic idea.

If someone gets your goat, it's because you let them
get it. A person can simply choose not to get drawn
into pissing contests. I suspect a lot of flame wars
are carried on by those who see the usenet as being
"for entertainment purposes only". Again, we have
free will over our actions. We needn't take every
opinion posted on the newsgroup as a personal
attack. Although it seems some do.

hence antron 99's nick name "splatter stick".....there is several things you
can do...#1 run a legal station....and keep your modulation no more than
100%....install a low pass filter at the back of the radio...
if you have done this and still come in on the phones then move your antenna
to the other side of the house. if the antenna is at the same level that
the neighbors are then raise it above them. a good 5/8 wave antenna will
out do the 99 and bleeds alot less. so you may want to shop around and if
all that fails there are some good high pass phone filters that should do
the trick.....after that let them call bill clinton if they want to.
you've done your part. ... . just make sure your station is
clean....

408. Re: ...and now 2950 problems 78o

Newsgroup: rec.radio.cb
Date: 1999-08-03 00:00:00 UTC
From: CodysPC@Iserv.Net
Message-ID: <37a75951.2505160@news.iserv.net>
Source record: 408

Greetings!

No, this is a voltage problem.

How the backup battery?

Does the radio reset itself often?

There are two voltage regulators on the CPU board, one for 8V the other for 5V. It sounds like one of these regulators that powers the main buss of the LCD display, might be under "foldback".

Foldback is when the regulator can't deliver it's rated voltage to the numbers of amps [current] it's trying to source from it to the parts that are requesting power from it. It simply drops voltage.

It could also be from a switch, but the RCI is push-button. I'd check voltage regulation on the main board PCB as well. The noise blanker and these other circuits are powered by the main 8 volt regulator on the main PCB. If the voltage is low, the "toggle" to show logic 1 to the main PCB to turn on that portion of a circuit is actually sinking current from the front PCB and should be checked and gone over to ensure there are no loose connections. This would make the "BEEP" NB and other symbols that are logic indications that these circuits are on, to show weak in the display because they are lacking voltage to make them "twist" in the LCD display to show that they are on.

These logic toggles, are buffered to the outside, or to the main PCB. If the main PCB or on-CPU regulators are overtaxed, the dimming occurs.

Check for cracks in the PCB's both the CPU's and the Main RF boards right around connectors.

Some some points of ponderment...

Hope this helps.

On Mon, 02 Aug 1999 01:02:25 -0400, While the Monitor displayed an idea about "...and now 2950 problems 78o" from 'aardvark <stumpy@noisp.com>'. The Keyboard responded with this:

Message-ID: <37a75c96.3342305@news.iserv.net>
Source record: 410

Greetings!

On Tue, 03 Aug 1999 02:41:40 GMT, While the Monitor displayed an idea about "Question on Antenna and Speaker" from '"Jon Grahmann" <jonboy74@bigfoot.com>'. The Keyboard responded with this:

:+> Bought a Uniden CB based on the posts here, but have a question
:+> about the antenna I bought and about a PA speaker.

Ok, Hope you aren't dissapointed in the Uniden. If this is your first time at it, take a moment or two to search the web to find out things about Uniden - you be happily surprized...

:+>
:+> Antenna - Bought a Radio Shack fiber glass antenna -48" whip
:+> Should have excellent grounding

A permament mount is the only way to get "excellent grounding". However, a good mag-mount and the radio mounted to metal that grounded to the vehcile - will also get you some good results.

Placement of the antenna/mag-mount is the problem. On the roof for best results and ease of tuning, but any other location you'll have to settle for what you get in performance.

:+> PA - Are all PA speakers for CB's created equal? What is
:+> a fair price for a decent PA and what should I look for
:+> when I go buy one?

Most PA speakers are rated in Watts, I'd go with one thats at least 10 watts in capacity [rated watts]. Some PA/Bullhorns can go as high as $35 dollars. Check and shop around, 10 watts is about the least you want to go for long life and understandable speech out of it.

414. Re: Dragon 30

Newsgroup: rec.radio.cb
Date: 1999-08-03 00:00:00 UTC
From: CodysPC@Iserv.Net
Message-ID: <37a75e19.3728930@news.iserv.net>
Source record: 414

Greetings!

Out of the box, 3 ~ 4 amps. Maybe 25-40 watts SSB, and it's not too tolerant of high drive - so keep modulation and/or power low when driving it on SSB. AM too.

A little "tweaking" you'll get 5 amps and maybe 40 watts AM, and yes it does get warm and it does sound cruddy when overdriven.

To me though, it's not worth the trouble.

Maybe as a small low-power modulator, yes it works for that, but any two pill will get you there a lot better than the "Dragon" or Mosquito.

I just don't want to see you go after low power and find out that the radio sounded better without it than it did when it was on.

Good luck.

If all else, it makes a neat paperweight and conversation piece. ;-)

On Mon, 2 Aug 1999 22:53:20 -0400 (EDT), While the Monitor displayed an idea about "Dragon 30" from 'thumper485@webtv.net (Chris)'. The Keyboard responded with this:

Greetings!

If you want good general performance, anything in the 5 foot or longer antenna length range, will put you in the running.

Mag-mount's work, but a permament mount [the ones that require drilling holes - gulp] is the best. Even if you only put a 2' antenna on a permament mount - it will do better than a mag-mount of the same antenna.

Oh, be sure to set you WIN_98.INI file to read...

CAPS-LOCK=off.

Thank you.

On Mon, 02 Aug 1999 21:58:03 -0700, While the Monitor displayed an idea about "ANTENNA Q'S AGAIN" from 'Paul and Melina Moore <Paul_Moore@bc.sympatico.ca>'. The Keyboard responded with this:

Greetings!

No, it doesn't help the antenna any. It won't help reduce noise, or strengthen signals.

The only thing it will do, is allow the radio to "see" a low SWR. But anything past the Antenna-Matcher, is still the poor antenna's own SWR.

On Fri, 09 Jul 1999 04:00:23 -0400, While the Monitor displayed an idea about "ANTENNA TUNNER" from 'Saturn1000 <Saturn1000@earthlink.net>'. The Keyboard responded with this:

Gary: This is a great example of the ineffectiveness of grounding to prevent RFI and/or TVI. As always, interference is tough to troubleshoot correctly when you're not on the site. My diagnosis is feedline radiation. Most likely, the coax has less-than-the-best shielding, combined with no decoupling at the antenna, and finally the whole station is pretty close physically to the stuff picking up the interference. No amount of grounding whatever will fix this set of problems. Here's a few suggestions that just might work.
1. Move the antenna higher, and far away from the neighbor's property.
2. Change to a ground plane-type antenna. No, adding radials to an Antron won't usually work! Maco V-5/8 is good.
3. Use a GOOD grade of coax, with a very high percentage of shielding. I use Belden 9913, because it's double shielded. Other coax will work, but no cheap stuff!!
4. A choke made by coiling 6 turns of the coax about 6 inches in diameter, taped nicely together,right at the base of the antenna, will keep lots of RF off the outside of the coax.
This is only a starter. If the modulation is excessive, or the radio has been dinked with, this only adds to the complexity of the problem. I also recommend downloading the FCC's interference booklet from their website at
fcc.gov. Eliminating interference is tough but do-able. Hope this helps.

Damn, thats a dirty setup- I bet you also use a transistorized base amp.
Dump the galaxy- get a clean radio that has the mod limiter still
installed, dump the A99 and get a Maco 5/8.

It will be all good.

receive and
> transmit in alignment while in manual mode?
>
> Thanks,
> Ken
...One of the problems with using the manual side is that it was
never meant or designed to work as a vfo on TX.
...The voltage regulation is poor on the hi voltage supply to the
vfo.
...Tram designed this radio to rcv only on the vfo and didn't put
any effort into the stability of the vfo for TX purposes.
...What you can do.Since there were a couple of ways to mod the
radio you'll need to discover a couple things before hand.
...First, with a freq counter or well calibrated rcvr, check to see
if the xtal osc.'s are correct on freq and that they don't change
freq between TX and rx. This is done with the manual side on. If
these are good then the next thing to check is that the vfo is not
changing freq too much between TX and rcv.
...More than likely the vfo is the culprit. You can minimize the
shift in freq by running a ground strap along the pcb. The straps
are to correct the poor grounding between the vfo cap and coil
(mounted on the chassis) and the actual vfo osc tube on the pcb. I
just made short jumpers from point to point along the pcb in a way
that produced the straightest path to the tube ground from where the
coil is grounded.
...Next I installed a zener diode regulator in the plate supply to
the vfo tube. This helped considerably and if I remember correctly
you could also do this in the cathode of the vfo tube circuit if you
didn't want to mess with hi voltage.
...These mods should produce a vfo that has less than about 30-40
cycles shift between TX and rcv.
...A note on those xtals. The main osc xtal bank is switched off in
the manual mode except for a couple of the xtals. These xtals are
used for the offset between the am and ssb modes. These xtals have
an adjustment pot on the main xtal board that can be used to improve
the shift between TX and rcv if it is wired correctly.
...Like I said before, there's a couple ways to mod the radio and

some are more involved but produce a more useable radio.
...Good luck in finding someone who knows these units well enough to
make the improvements.

I agree. However, no matter what you do, you couldn't set it for
a 500 watt dead-key and have it not backswing on an average-reading
Bird 43.

If I'm not mistaken, that's what someone who responded to the
original poster said. That's simply not the case. To make the
deadkey wattage hold on a Bird 43 when modulation is applied
the peak wattage has to be 3 times the original deadkey wattage.
For example, if an amp deadkeys at 500 the peak power will have
to be at least 1500 otherwise you'll see backswing on a Bird 43.
Making a Texas Star 500 peak at 1500 watts will require the use
of just about every competition trick there is--there's absolutely
no way that it'll do it in stock form.

-=PEAKABOO=- wrote:
>
> Hey Bill what radio were you driving these DX-500Rs with?

A tuned up President Jackson (MRF477 final).

The power supply is a Vietnam era Army surplus
unit (designed in 1962 and built in 1975) that
runs on 220 and feeds 1/0 cable that ends in a
homebrew terminal block (a piece of wood with
carriage bolts through it) on my test bench.
It's potential output is in the 120 amps at 19
volts (2280 watts) range.

The dummy load is a finned, oil-filled, 600 watt
continuous type that came from Raytheon but was
made by some other company.

The meter is a Welz-built Palomar PW-5000 whose
peak measurements run hand-in-hand with my military
Bird 43 that has the latest generation peak-reading
kit in it.

The bottom line is that I'm pretty damned confident
that my readings are accurate within +/-5% under the
test conditions that I laid out. If you've followed
this newsgroup for any length of time you'll know
that the wattage readings I post are generally considered
to be very conservative--and that's putting it lightly.
A few people have all but accused me of posting
artificially low readings. So, if you duplicate my
test conditions, chances are you'll see my numbers
or even higher numbers.

The Texas Star 500R is a kick-ass amp, but it has
it's limitations. ANYONE--I don't care who they
are, would be hard pressed to make a 500R produce
500 average watts at full modulation on a Bird 43.
It would take full comp set-up to make that happen.
Full comp set-ups run 10 seconds out of every 20
minutes--they aren't practical, daily-use set-ups.

In a mobile--yes. In many cases the 636L is even better
and it costs less.

In a mobile--especially a noisy mobile--you want maximum
noise cancelling. The 636L Astatic and the RK56 Turner
are by far the best choices in that situation.

You don't--the guy doesn't know what he's talking about.

You can play with turns ratios and capacitance values
all day, but you won't see more power until you increase
the drive and supply voltage.

I agree. Dragon, Mosquito--whatever they're called
they're of minimal value.

Think about it--the output power transistor in that
amp is the same one that's used in most sideband CB
radios--the 2SC1969. You can't squeeze blood out of
a rock. To get increased power you have to use more
and heavier power transistors. A pair of MRF455s is
what I consider the minimum required to make an amp
worthwhile.

If you are running legal power, don't worry about the phone calls to Uncle Charlie. A big part of the problem is the Part 15 devices being interferred with. First, I'm not sure why or how you grounded the antenna, but did you ground the radio--Not to the electrical plug, but to a ground rod, seperate from the house elecrical ground, and short-avoiding a 1/4, 1/2 wavelength of 11 meters? If the radio is located near an outside wall, go through the wall and use a copper clad rod right there. If this hasn't got it, and yes, your radio is legal, then the ball goes to the neighbor. Offer them some ferrite material to wrap phone and stereo wiring. Under no circumstances should you enter their home and do any work for them. Can you spell law suit? No doubt they have a 6 meter phone and not one of the newer 900 MHz jobs. Those just never have a problem. You can offer them some .01 mF caps to put across the phone microphone wiring and at the speaker of the stereo system, but you have to be very careful with the speakers to prevent them from going into oscillation.

I'd say there is a good comparison. All forms of two way radio is
amateur radio. Just because someone doesn't know how to build an amp
or an antenna doesn't mean they aren't every bit of an amateur radio
enthusiast as a licenced ham.

>They are two separate services with unique rules. There is no
>overlap other than rf. I am here because I use CB and I do it legally, and I am

There is an overlap. The CB rules are basically a derived set of the
amateur rules and hence are a more specialized set of rules.

Close but no cigar. An antenna tuner is used to adjust high vswr so that the transmitter sees the antenna as a 50 ohm 1:1 match. A better antenna might improve your reception.

Thats sort of a problem. One thing a proper operating CB needs is a
good antenna, which means a fairly big antenna. I personally think a
Wilson 1000 makes a car look better, but thats just me. Anyway, about
the minimum you would want to go with is maybe a Wilson little Wil'.
Its a base loaded whip antenna, but its not as big as the 1000. And
it will not work as well.

You can get a cellular look-a-like, but it won't work any better than
maybe 2 miles.

Look for a SSB mode and class AB biasing for SSB and possibly a bias mode change for AM. An RF pre-amp is good for receive. Try the Texas Star 667V. It is AB biased for clean SSB plus a pre-amp and I happen to have one for sale as well.

I'd suggest either a PC66 or 68 from Uniden. They are available with weather bands, and can be modified for +/- 40 xtra ch's.

>I'm putting this in a sports car, and I don't necessarily want another
>antenna. A glass mount wouldn't be too bad, but what about adapting the
>AM/FM to CB use?

As the others have stated, the antenna is a critical part of your communication. A top loaded whip mounted to a bracket that bolts to the frame from under the back bumper would save your paint, alot of vette owners use this.

You're kidding, right? Let's see, there is amateur, cb, frs, marine, mars, cap, and perhaps something I have overlooked. Some require knowledge, background and testing, others require that you write a check at Walmart. All amateur? Get real. You might be a radio enthusiast, but you are NOT an amateur enthusiast.

More specialized meaning more restrictive, i.e., you have the ability to buy stock equipment, do nothing other than plug it in and talk. You can't operate any mode except phone. You are not required to know any more than the difference between a positive and negative wire if that. Look at the nature of the questions and answers here. There is nothing wrong, second class or otherwise about CB. It can be compared to nothing other than CB and perhaps FRS. If you want to be an amateur, go get a license. Nothing stopping you except your willingness to get after it. You are catering to those here who claim that all CBers are amateur wannabees.

461. Best Cheap Center Load Telescopic for Handheld?

Newsgroup: rec.radio.cb
Date: 1999-08-04 00:00:00 UTC
From: steveei@my-deja.com
Message-ID: <7o8af4$iu2$1@nnrp1.deja.com>
Source record: 461

As reported in rec.radio.cb before, http://www.rebateco.com is selling GE 40 channel handhelds, free after rebate except for $3.99 shipping. Given the price, my father-in-law and I have each ordered one, and I expect to use them in late-summer hiking.

Reading past messages here, it seems that these GE handhelds have OK electronics, but their range is usually poor due to a too-short original antenna. To bring range up to a couple miles, the two most popular recommendations seem to be:

A. Buy Maxon WTA-1 42" telescoping antennas specially made for handhelds. These seem to cost at least $32 a pair including shipping.

B. Get center load telescopic car/truck mount CB antennas, probably using a BNC to UHF adapter to hook into the handheld. This option, according to one poster, is "slightly more cumbersome" than the Maxon but gives "much better range."

Now, my question. Can anyone recommend a not-overly-cumbersome antenna model of type "B" above that will both work well and come close to the Maxon WTA-1 price?

Thanks for all ideas.

I want to set up a communication line between a rural village and a church in San Pedro Sula, Honduras. The distance between them is about 10 miles, through hilly terrain, elevation change is about 600 feet. What is the best way to communicate when there are no phones or cells? CB? Ham radio? Something else?

Your help in this matter is much appreciated.

Yep, stay away from the 1969 and MS1306 baby amps, they burn out very
easily, but Bill, a single pill, 455, 1446 or bigger, would be
doubling your power four or five times over a 4 watt radio, I'd call
this is a worthwhile increase in a small, low current package.
Of course it's not as cost effective as a two pill amp since it has
all the same parts, less one transistor.

CB might work, if you put up good antennas and can tolerate some interference. This is already a standard means of communication in parts of the world where telephone service is non-existent or unreliable.

Be aware that, by international agreement, there are frequencies scattered throughout the radio spectrum to accommodate a wide variety of situations similar to yours. You would have a choice of several ITU channels with different characteristics to allow you to avoid interference or to take advantage of day/night propogation.

You will not find these transcievers in regular CB or Ham stores. However, they are available "off the shelf" if you go to the right places. If you need a referral to a resource, E-Mail me at QRM2000@aol.com and I'll put you in touch with some folks who have helped in other church and medical missionary situations. One caution: These ITU Channel radios cost hundreds of dollars apiece. CB is much less expensive.

Best regards,
QRM

>you are NOT an amateur enthusiast.
>
>
QRM sez:
EASY, Boys! Let's not start at 250-message thread. Both of you are saying the same thing, but in different ways.

CB could be construed as "amateur" in that it is not "professional". Meanwhile, the Amateur Radio Service is so-called because in the beginning, that is where experimenters could "fiddle" with their equipment. In the very early days, no license was required, by the way. Only when regulation was brought in to bring sense out of chaos did the license and call letter system begin to evolve.

Jenkins quoted someone thus:
>> >They are two separate services with unique rules. There is no
>> >overlap other than rf. I am here because I use CB and I do it legally, and
>I am........

And Jenkins responded:
>>
>> There is an overlap. The CB rules are basically a derived set of the
>> amateur rules and hence are a more specialized set of rules.
>
>
QRM sez:
As a student of both sets of rules, I disagree with Jenkins on this point. The CB rules are unique to the radio service to which they apply. There is virtually NO overlap between CB and Ham regulations. The CB rules were created specifically for that radio service. CB is NOT a "junior varsity" Amateur radio service. It stands on its own. One does not "move up" to ham radio from CB. He or she simply "adds" a ham license (and the resulting frequencies and modes).

Gary commented:
> There is nothing
>wrong, second class or otherwise about CB. It can be compared to nothing
>other than CB and perhaps FRS.

To which QRM says:
AMEN !

Every time I have sent an amp to #12 it always comes back with a higher output. Maybe tuning is the wrong word. I just leave it to the best and I am not disappointed. If you want to know what he does; pay the price to have one "tuned" and then look inside.
Many times changing the feed wire size, fuse scheme etc. will allow more power thus increasing output.

Just thought I would pass this on I have used Ebay several times with out problems and dont know what happened but I got confirmation saying I was the winning bidder on a radio that I did not bid on. I did look at the radio on thier site but that was it.Just wondering if I got hacked because the only other strange thing that happened yesterday was I got a blue screen with an eception ereror while online dont know if this had any bearing on what happened or not and by the way it did happen while on ebay and lock the pc up.

hey fellows,

when i go to (dont click!!!) www.coaxkid.com (don't clikc!!!!! you will crash!!!!) my netscape browser crashes as the page finishes loading. last week the site worked, this week my browser error messages and then closes. just thought i wouild let everyone know. how can you sell stuf if your site don't work.

anyway i been looking at the uniden 122xl ssb and the lil' will magnet(i work in queens ny, raido theft capital of NYC)antenna package jcre has for like 110 bucks(i think). does anyone have any experence with these products.

any recomends on a 100w amp in the 100-200 range for this ssb rig??

i like the small size of the 122 to mount perfect in the dash of my 86 volvo turbo wagon, in place of the no longer hooked up factory auido equalizer. looks like i got about 5.5" x 2" and 8-9" deep(can go wider if i have too, but i will loose my cig. lighter)

. anyone know the exact demensions of that uniden? i check unidens website and everyones elese, even talked with the boss of jcre the other day and no one has an answer to the demensions. anyone know the numbers exact?, unidens 800 operator Amy ,is sending me the info in the mail but could not tell me measurements, there in a different dept, figure that one out......anyone? sanil mail is sooo slow

and what about these export raidos? if i wanted to be ham guy down the raod and wanted to buy an ssb mobile export for under 200 bucks, any recomends on export raido, antenna and amp? for like <300 bucks?like a good start set-up... this way i could beam out on the raido

hey , let me thank everyone for the help and advice in advance.

think there is a hacker on coaxkids site?

Message-ID: <37A872AC.BB18407C@home.com>
Source record: 500

Hey, Oris, you trying to make it look like all HAM's are angels? Hope not, take a gander at this:

"A South Carolina ham who was the target of an FCC enforcement action has turned in his Amateur Radio license rather than accept a license modification that would have kept him off the HF bands for four months.

Under a license modification imposed June 30, Whiten was to stay off the HF bands until October 25. In return, assuming no further violations, the FCC would clear its books of any outstanding FCC enforcement issues and grant his vanity call sign request. Whiten had been given 30 days to protest the license modification.

WB2OTK has run afoul of the FCC on several accounts. In late January, Hollingsworth and an FCC engineering team visited Whiten's station after what Hollingsworth called "longstanding complaints" about its operation. Whiten reportedly cooperated in the station inspection. The FCC says it's received "numerous complaints" about Whiten "regarding profanity, obscenity, broadcasting extreme racial slurs, deliberate interference and failure to properly identify."

In April, the FCC sent Whiten tape recordings of transmissions from his station made on two occasions in November and asked him to explain their contents.
Whiten responded in May. Citing privacy concerns, the FCC has not gone into details about Whiten's explanations for what was on the tapes, but Hollingsworth noted in his June 30 letter ordering the modification that Whiten had apologized for the operation of his station on the dates in question."

Guess the FCC is too busy cleaning up licensed radio operators to deal with the unlicensed CBers, eh?

Good day mate.

Well the best antenna I have ever used is a Wilson 1000 Mag mount. It has
good gain and great reception. You can get it from Coppers magazine or here

http://www.copper.com

It is a very dependable antenna.
About the radio, you would need to hav the exact model and look on the
internet for Mods.

Hope that helps....Doug

Hi Richard,

If this is an 18channel radio, it definately isn't like the Washington I had years ago. Mine was 40 channels and used the uPD858c PLL. If you like, I do have the schematic scanned into BMP format and could Email it too you. Just Email be after 7pm USA EDT and I'll fix you up tonight when I get home.

Cheers!
Andy

Then there was probably temporary corruption of an incorrectly registered .DLL, or permenant corruption of the .DLL and/or .EXE itself. Though, since it atleast runs, it could be the .EXE, but more than likely the .DLL. It is not his site. His site may "trigger" an "affect" caused by this corruption, though, it is certainly not his site itself.

>products.
>

Why waste your time with the Lil' Wil then? Go with a Wilson 1000. Though, the Lil' Wil is a nice little antenna. You could most certainly spend a little more a go with a better one. PC 122 XL is a decent little radio... I dont care much for its modulation properties, but.... just my own opinion I suppose.. (and yes, that is which the diode bias mod)

>any recomends on a 100w amp in the 100-200 range for this ssb rig??
>

$100-$200 you mean? I would say, I wouldnt waste my money. 100 watts really doesnt do much, atleast in your area. Not enough in my mind for the price you would pay. If you must, go with something bigger.

Take care.

Hank

Yes. Sign the back of the check and mail it to:

Hank Aaron
4231 E. Water St.
Harrisburg, PA 17011

I will gladly purchase the radio equipment that I think you should have.

I would also, gladly keep that equipment that I buy, of which I think you should own also...

On a more serious note... What are you looking for..? What do you want to be able to do. $500.00 is a decent chunk of change to spend on radio equipment. Considering... Do you want a base, or mobile? Do you wish to talk a lot of SSB, or X channels?

Hank

Yea I know about porkbut! He is a real work of art and its about time the FCC did something about that slob! All I was doing was making people who have CB radios aware of the power the FCC has. They need no search warrant. All they have to know is there is a CB radio in your house. GO FIGURE! If the FCC is visting your in trouble for something.

I've been making some CONUS contacts and traffic has been high. I'm new to CB radio and have a question for you DX'ers. Where do you guys get the callsigns you are using? They don't seem to be Amateur callsigns, but I may be mistaken. Usually three numbers. Are these through DX clubs? Please, point me in the right direction if I should have one. Thanks,

Saw this posted in a truck stop. Thought you might need it.

****

"THE ILLEGAL CB'ERS PRAYER"

O Lord.

Wipe away the whiners and criticizers.

Smite the complainers and silence the mud ducks.

Forgive them Lord, for they know not the pleasure
(and profit) that comes from high power.

Help us this day to create a multitude of watts.

Give us safe haven for our illegal commerce.

Grant us more mods for the Grant.

Keep us free from responsibility and common sense.

And let Texas Star shine forever in the firmament.

Amen.

I was just curious, I was not disagreeing with your claims, I just had two of them on my bench and the only way I could get 700 peak watts out of one them was to run the voltage to about 14.5 and hit them with a one pill, On the 43's they were doing 350,that was on 1K slug (new not surplus) and my power supply is a haus, 200 amps continuous, about 400 pounds, PC 76 on the bench.

Where did you see $16 ea ($32 a pair) I bought these same radios with
the same intent, new antennas and use out camping, fishing, hunting,
etc.... Bill's 2 way has em for 19.90ea, I got 3 for my 3 radios (got em
at www.sportsmansguide.com for 29.99ea, still not bad). Problem is I am
temporaraly stuck with using the ext. antenna jack on the side. I had to
go to rat shack to get a BNC to Phono adapter. That still has the center
conductor and the outer ground or shield. I have yet to find one that
goes from BNC to the 1/4 inch by fine pitch thread that the stock rubber
ducky antenna uses. So far I am happy with em, just need to scrape up
the right $2 adapter, or whatever that kind of adapter costs
> B. Get center load telescopic car/truck mount CB antennas, probably
> using a BNC to UHF adapter to hook into the handheld. This option,
> according to one poster, is "slightly more cumbersome" than the Maxon
> but gives "much better range."
I'm driving my parents corsica right now as I am restoring my other car,
so I have one of these hooked up to a magnet mount antenna, just a rat
shack cheepie, but it works good (dad don't want me drillin holes or
rewiring the damn thing...)
> Now, my question. Can anyone recommend a not-overly-cumbersome

My suggestion, get the WTA-1 and let me know if you find the right
adapter, and if I find it I'll let everyone know too. Good luck! Gonna
get me another for free now, thanks for the link to this outfit!!

Oris,

Well, I don't know that I agree completely. I've read of plenty of instances where the FCC knocked on the door and was refused entry/inspection. The result was that the HAM operator, if I recall correctly, immediately lost his license. By your reasoning, the FCC could enter any house at any time, since you don't have to have any visible signs of running a station. They can knock on my door, but without a search warrant, I'd hate it for them if they attempted entry without permission.

And it's just not people with CB's, but also those HAM operators, porkbut <sic> or not. I've listened plenty on 2m and 10m and heard conversations go on and on with no identification given by the HAM operators. Isn't that against FCC rules? Go figure.

Is English a second language for you?? Perhaps you should read and comprehend a post before you reply antagonisticly or at all!! I am inquiring about the CALLSIGNS DX'ers use not the freakin' channel, Pinhead!! And let's suppose for a minute I did actually ask which channel CB'ers DX on. What's the FREAKIN problem with that??? This is a NEWSGROUP, is it not?

Please read this post slowly before you reply, Buckaroo. If necessary, have someone translate into your native language. Once you fully comprehend the text, formulate a response and post literately. Also, reconsider the urge be such a jerk in that reply.

Oh, also check out http://www.thomas-distributing.com/ for some cheap 1350mAh AA batteries, I bought some cuz they got over 2x the cap of NiCD because they are NiMH and cheaper than NiCD in stores, I bought 36 AA for round 70 bucks, and they work great plus a quick charger and a slow charger and 8 AAA totaled round 145 but well worth it in the long run!!

There are about 15 to 20 kids in my neighborhood that live about a half mile from each other. They all have base stations and are all running powerful amps. What I don't understand is, none of them even try to talk any distance or even try to talk skip when it rolls in. My question is," why does someone need several hundred watts to talk to someone a few blocks away? All they talk about is how much interference they are causing to their neighbors.

>Go figure.

Question:

The FCC can inspect your station.

If you are an amateur they know you have a station because of your
license. However, if you have no license then how can the FCC or any
other government agency have an automatic search warrant for your
premiss without the knowledge of a station being present. I agree that
the ownership of a CB constitutes a station which will allow the FCC
to inspect. Proven transmissions that the FCC can show you are
evidence of a station also.

As far as i can determine, mere possession of a CB (if known by the
FCC) can be used to legitimize an inspection. However mere possession
of a non CB (amateur radio) can not be used as a legitimate reason for
an inspection. It does not meet the requirements for what defines a CB
station, and as long as there is no evidence of transmission there is
no evidence of a station. A antenna is not evidence of ownership of a
CB radio, or evidence of running a station (transmitting).

My question is what is the FCC required to show as evidence of
ownership of a CB station, or operation of a station before their
automatic search warrant can be used.

Looks like you have to live with it. Even if it means not being able to use your CB radio. What's sad is that techs and equipment dealers discourage enforcement or peer pressure that could curb this kind of behavior -- all because they need to stay in business and keep selling amps.

I'm having the same problem with a 2600 with a chip-switch.
In addition sometimes the radio will not transmit, a gentle tap to the radio gets it going again.
My guess is a bad solder joint in the chipswitch socket.
I have several other radios, and I have not taken the covers off my 2600 to start looking for answer yet.

Any any "reasonable hour."

>I've listened plenty on 2m and 10m and heard conversations go on and on
>with no identification given by the HAM operators. Isn't that against FCC
>rules?

Probably. The requirement for identifying at the beginning of a transmission
has been deleted. However, an amateur still must ID once every 10 minutes and
at the end of the "work".

> I've read of plenty of instances
>where the FCC knocked on the door and was refused entry/inspection. The
>result

Great words from a lady at Radio Free Ashville (NC), a pirate broadcasting
facility, when being interviewed on TV:

"Yeah. The guy was in a suit and everything. But I didn't let him in and he
went away."

(The station was "busted" with FCC and Federal Marshal Service personnel a few
hours later).

The law says in essence that you are regulated by the FCC. If you transmit, you are subject to inspection. If the field agent is aware of your transmission times and df's your house, antenna or no antenna, and determines a probability of excess power or other irregularities, he is within the law to inspect the station. This is not to say he is given carte blanche to look at the whole house and find the heroin stash under your bed. If I can df a bad door bell transformer from a couple blocks away, right down to the closet it was in, I'm certain that the FCC with its big-bucks equipment can find a transmitter in a house with no visible antenna.

Transmission on ANY frequency, CB, amateur, whatever, constitutes a station, and is then subject to inspection. Amateurs certainly are not exempt.

>
> My question is what is the FCC required to show as evidence of
> ownership of a CB station, or operation of a station before their
> automatic search warrant can be used.

Transmissions of any kind constitues a station and can be inspected, but it would be unlikely if the initial data gathered indicated that the station was in compliance.

The rules state that you must make your station equipment available
for inspection upon request. This doesn't mean they are allowed to
come into your house and search for a station.

I guess if you refuse, and they still keep getting complaints about
your station, then they can get a judge to issue a search warrant.

>CB? Ham radio? Something else?

<<This could easily be done with a couple of stock CB's and two Antron
99 antennas.>>

CB is used all over South America for exactly this purpose: a cheap and
efficient medium distance village-to-village intercom. Although in Honduras
you will likely get 'skip' from the USA during daylight hours. (Cover the kids
ears)

Well, yes and no. The full quarter wavelength antenna would be presumed to be best, and it would be compared to other antennas of equal or shorter electrical lengths, if it was stationary. The rub comes when you start the vehicle in motion. Wind load on the whip forces it to arch to the rear and this changes the pattern of radiation. If you are attempting to reach a station to the side of you then this would improve the possibilities. If you are trying to reach someone in front of or behind you, then the communication abilities would be degraded.

Those call signs are usually through clubs. Like my call sign is
DW001. I am the first member of the SSB club called "The Disney World
Single Sideband Club." We don't have anything to do with Disney
World, but since we are located in Central Florida, and Disney World
is pretty much known to be in Central Florida by everyone, this is the
name of our club.

The 102" whip. They look good on trucks, but not to good on cars.

>opinions I'd get. Also, where is the cheapest place to get a nice
>chromed 102" whip or can one make it themself, using heavy gauge steel

I don't think a chromed whip is made. Don't make the whip yourself,
go to Radio Shack and get one.

It doesn't mean they get to stand at the front door and you parade the various components by. They can inspect the station. If the station is on the second floor, they can go to the second floor to look at it. If you refuse entry, you are already in violation and it goes down hill from there.

>
> I guess if you refuse, and they still keep getting complaints about
> your station, then they can get a judge to issue a search warrant.

Search warrant is not required. The law states that by operating a station, you have given permission for the inspection. Since you have already given permission, no warrant is required, and if you refuse entry, you are guilty of refusing an inspection, hence, all equipment can be confiscated.

I have no problem with a confirmed transmission. However before i
would let anyone in my house i would like to see evidence of this
confirmed transmission. Any thing other than that would not be a legal
search as far as i am concerned.

Agreed. You can't beat the new NiMH batteries. They contain more
energy and do not have a memory. The only thing better than NiMH
are the new rechargeable lithium batteries. They also do not have a
memory but are much more expensive than the NiMH.

While on the subject, the Maha MH-C77 universal charger can not be
beat. It can automatically discharge and sense the proper voltage to
recharge any rechargeable battery between 4.8v and 12v. If one
wants to charge a smaller voltage like the 1.5 volt cells all one has
to do is buy a four battery holder and charge all four at the same
time. As long as these four batteries are kept as a matched set from
the beginning then you will have no problem with unequal charging.

Nothing beats the 102" steel whip for mobile use. I've tried a Wilson 1000 on the roof and the whip beats it HANDS DOWN. It's much more broadbanded than any base loaded coil antenna. The wind laying the antenna back at speed causes no significant signal loss, as the entire length of the whip radiates. Radio Shack sells the whip for $14.99, the mount is $12.99, and spring is $12.99. If you don't mind the way it looks and performance is your #1 concern, you won't be disappointed.

CB "Callsigns" come from a variety of places. Since no skill or radio
etiquette is required, you can find them in the usual places

1. Cracker Jack Boxes
2. In the little prizes in the vending machine in the dime store
3. Use part of your former prisoner ID number
4. Use the last 3 numbers from your food stamp ID number
5. Use a few numbers off the license of yer favorite pickemup truck

You're welcome

The items you mention boil down to increases in supply voltage
and drive power.

I've talked to Dennis (aka #12) and I know what he does.
He removes inefficiencies that exist in certain amp designs.

I've provided him with information that has simplified his
task.

Dennis is not the only guy that's ever been on this newsgroup
that understands amplifiers.

If you want to view him as some sort of amplifier God--that's
your right. Just keep in mind that others (who are still
out here even though Dennis has run off) understand amplifiers.

A fella just gave me a CB and I was wondering if it's worth mounting in my truck. I was thinking of getting one for hunting and offroading in case of break down or something, and he pulled it out and handed it over.

It's a Realistic 4 watt CB with 23 channels. It has AM, USB, and LSB. I don't know diddly about what this means other than the fact that the other CB's I've seen have 40 channels. It has RF gain, and squelch, etc. I don't know much about that either, other than someone told me they were important and not always on cheap radios. I also need an antenna that will work in some ravines and riverbottoms. Any suggestions? This is for a '94 F150 4x4. TIA....

While they are knocking is not the best time to figure out how you will handle it. Find an attorney friend and run it by him/her in advance.

Remember, the FCC comes to the fight with experience. You and I will be going through it for the first time. That makes it their "turf", unless you are prepared.

Just a thought......

>Why do they require a CW license to get phone on 10 meters but not on
>2 meters?

The reason the FCC requires you to know morse code on 10m but not 2m
is simple. The 10m band is an HF band to which you can communicate to
people in all parts of the world under certain tropospheric
conditions. The 2m band is a VHF or UHF band for which you cannot
easily communicate to people around the globe. Some people need to
study up on basic amateur radiio knowledge!

102" whip is best. You can read about firestick's claim of being 5/8 wave, or Wilson's claim of being better than the K-40, or K-40's claim that they make the best mobile antenna you'll ever own, etc, etc, etc. These are all good antennas, but remember this: the longer an antenna is, the better it will work.

>
>

It has long been an ITU regulation that CW is required for a license to operate hobby-style radios below 30 MHz. FCC rules must conform to International law. Brandon White's post explains the propogation differences between 2M and 10M.

CB is exempt because originally the radios used crystal control (and later were channelized). In theory, the operator of a CB radio cannot get "out of his band" and cause harmful interference. Can you guess that all these laws were written before the advent of "export" radios?

>Manitoba, Canada
>~=O)

Most of the traffic is on the lower 23 channels, so not having all 40
isn't a big loss for a beginner. SSB users have all moved to the upper
channels 37-40, and you probably won't use it anyway until you get
more into radio. The main thing to remember is the longer the
antenna, and the higher you mount it, the better it works.
Have Fun,
CoaxKid dot Com

Another thing about CB, there are a lot of agitators out there trying
to make you lose your cool, if they succeed, you lose, if you don't
let their BS get to you, you win. Enjoy the radio, but don't take it
too seriously.

The same can be said for people who all live locally, within a few miles
of one another with mobiles. There is no reason, other than to boost
their egos. They must have the "biggest, baddest" radio system. It is
all competition. They will all try to talk over one another and other
juvenile behavior.

>YOUR DIRTY LIES AND

ETC ETC ETC

Well, Boys.....here it is, right on schedule. This time is was 29 days after the last troll. Just like clockwork. I don't know if it has to do with the phase of the moon or the troll's wife's monthly period.

To JammerHater (of that distinguished ISP WebTV):

First of all, I doubt that you really are a ham operator. If you are, you probably are brand new to the hobby. And you CERTAINLY are new to this NewsGroup. So here's some information that will help you:

1. Thanks, but we already know that it is not appropriate to transmit in the ham bands without a license.

2. And we already know that amplifiers are illegal.

3. If you don't like the language you hear on CB, don't go there. Or, change the channel and hang out with folks whose speech meets your standards and expectations.

4. When you come to CB by radio or by this NewsGroup, you "check your license" at the door. A ham license has no authority on CB. On CB, everyone is an equal. You'll find some CBers who are better operators and who have better equipment than you every dreamed of achieving.

Now, if you are simply a troll, consider the following:

The last troll attempt like this hardly got off the ground. The days of the 200-post threads started by people like you are over. We got wise after the third or fourth one. The only folks who will take the bait are newbies, and you will find that they learn fast.

In my private e-mail to you, I mentioned that I am a CBer and a ham. I've been licensed since 1961, and have been an Extra Class since 1964. I can talk your language. And I can usually spot a non-ham (or a brand new ham). Sure, hearing pirates in the ham bands is distrubing. But those folks don't read this NG. Shouting at everyone here will do no good.

If you really ARE concerned about non-licensed operators in the ham bands (especially 10 meters), e-mail me for details about a program called "Intruder Watch" and I'll give you some positive things you can do to help the situation.

Otherwise, There's the door.

QRM2000
As you leave, remember these great words from Geoge Jefferson of TV's All In The Family:

"Don't let the door knob hit you
where the good Lord split you."

623. TROLL ALERT. Read entire CBers Thread Before Responding

Newsgroup: rec.radio.cb
Date: 1999-08-05 00:00:00 UTC
From: qrm2000@aol.com
Message-ID: <19990805072757.23144.00000838@ng-fd1.aol.com>
Source record: 623

Actually, reading the entire thread before responding is good advice at any time. How often we see answers to the original post that duplicate numerous follow-up's!
Go through the responses and make note of what you want to say which has not been addressed already by somebody else. Then, and only then, should you go back and add your remarks. Voice your support for a position, or add new information and insight.

In the case of JAMMERHATER, this will be especially important. The first five or six responses will tell him everything he needs to know, hee hee. After that, it will just be posts from folks who read the original and shoot from the hip without reading further to see if the issue has been answered already.

Or, as we like to say of these people, "Ready....Fire....Aim!"

Best regards,
QRM2000

The amp doesn't have to be very big to generate that kind of interference at a local level. From the kid's perspective though, what is it hurting to break the law? It isn't hurting anyone, right?

> wife's birds!

You're absolutely right. In order to get more dues money flowing in, I hear the ARRL wants to limit the Technician test to one question using the following application form:

NAME: Last, First, Middle

Thank you, Please make your $25? check payable to The ARRL, Newington CT and you might receive a copy of QST Magazine in the next 6 months.

PS: Dont bother calling us with real Amateur Radio problems, we are only concerned with Political and Code issues. EXCEPTION: Unless you are calling from Saccucci Cadillac in Hartford to let us know that K1ZZ's ARRL company car is ready.

Thanks again for your support.

Well
I don't think anyone of us should refuse entry by the FCC. The FCC will only make things worse. The NAL below shows proof of this. What might of been a 300-700 buc fine has been changed to a 7000 buc fine. As far as the FCC is concerned they can inspect your station anytime they like.
I just love how you guys start complaining about amateur operators doing this or doing that. The way I see it its easier to point the finger at someone else vs pointing the finger at yourself. How many of you who are complaining about some idoit ham who doesn't ID run over power yourselves? How many of you who are complaining about hams doing this or doing that operate above channel 40 or below channel 1? But yet you want to pull the attention from yourselves on to amateur radio operator. Sweep your side of the street before you start pionting the finger at others.
Now to address the fools who don't ID right. Make a log of the behaivor. Write down the date time and frequency of the activity. Then write down the time between IDs. Write down the stations call, and what they are doing. Then Send it to the FCC. I will be willing to bet if there wasn't a call it wasn't a ham. It was some CBer working out of band. If you don't like to see hams not ID then do something about it. CBers have a much better chance of getting away with stuff then HAMS do. Heck we have a guy here in Danielsville GA that is right on main street got a sign up and everything doing illeagal Mods on CB radios stealing amps and repairing amps and the FCC knows about him and nothing is being done. They have known about him for years. So if they is a ham in your community doing things wrong on the ham bands the FCC will get him if he is known about. But if there is is a CBer in your community doing things wrong the FCC is less likly to do anything. The guy in Danielsville is a good example of this.
73 and stay legal and you won't have any problems

> I have no problem with a confirmed transmission. However before i
> would let anyone in my house i would like to see evidence of this
> confirmed transmission. Any thing other than that would not be a legal
> search as far as i am concerned.

The FCC's right to enter a dwelling is ADMINISTRATIVE LAW and not CONSTITUTIONAL LAW. This supposed right of theirs is such a violation of a persons civil rights it isn't even funny. An "electronic confirmed transmission" can be dealt in a court of law with as easy as a Troopers radar gun, a breathalyzer, or a lie detector test. Hell, DNA (which is accurate to about 7 zero's) couldn't even put OJ away. The only true confirmed transmission is when a witness is present in a room with a defendant when the illegality takes place and this same witness is willing to testify against the perpetrator in a court of law.

The FCC has been handing out fines knowing full well that the person being fined would spend more in legal fees defending the fine as compared to just paying the fine (which the FCC negotiates this fine if someone is willing not to challenge them). No-one has had the financial resources to take them to the Supreme Court to challenge this rule because if they did, it would be overturned in a heartbeat and considered as untrustworthy as a lie detector test is in a court of law.

The only time the FCC has right to enter your home looking for illegal transmitters is during a time of "War" or when under "Marshall Law" (and even this one is defendable).

Well, I'm glad you have this issue all worked out. Perhaps you should share your legal opinions with the attorney general. Perhaps you should present case law as well.

The FCC will never enter a home if there is no evidence of radio transmissions coming from the structure. If there is evidence, then said evidence is reportable to a court of law if needed. Beyond that, if there is evidence of transmissions, they have a legal right to inspect. If you want an iron clad guarantee that they won't knock on your door, get rid of your radio or seal it in plexiglas so nobody can use it. If you transmit, you are subject to inspection.

A while back there was a question within the FCC that the NAL amounts were being assigned without adequate research so a number of them were set aside. It turned out that the fine structure had been understated by quite a bit, so now, all NAL fine fees are >>consistent<<, based upon the violation, and substantially higher than before. Beyond that, all questions have been addressed regarding the equity of the fee amount, so the NAL's are sticking.

i would find out what the input drive requirements are for the amp.
if it requires, for example,a 50 watt drive and you are driving it with 25
watts your output will be lower.
i had a magnum 2000, (125 watts am, 200 watts ssb), which drew 25 amps max.
if yours draws the bulk of the max. output of your alternator and you run the
a/c and headlights also, this will affect your output too.
i had that amp in a 1987 yugo,(ok stop laughing), which had a 55 amp alternator
and a 1.1 liter shoebox with 4 mice.
if i keyed up on max., it really lugged the engine down. the pres. 2510 and amp
had more horse power than the engine did.
i hope this helps.
jeff

Hey, Oris, just tossing some examples of your beloved HAM's violating FCC rules. You don't like it being tossed back at you? Then don't toss the crap at us.

I read your web page, or at least up until I couldn't stomach the drivel anymore. You get what you deserve as far as CBers chunking HAM operators illegal activities back in your face. You don't like it, stay off the CB forums.

So go sweep your street, and when there are no more illegal HAMs, then step across and see if you can start sweeping our side.

And no, it was a legal transmission, because the 2nd station identified, the 1st never did. And I just know that no honest HAM would talk to a non-HAM on a HAM band, right?

Oris wrote:

OH NO! I'm agreeing with Wildcat!
He's right, the FCC has no right to enter your place without your permission unless they have a warrant or during other such emergencies he listed below. However if you refuse to allow them to inspect your station and they have to get a warrant you're going to be in lots of trouble. Part 95 requires that you allow the FCC to inspect your station at any time. No you didn't sign anything but when you keyed your microphone you agreed to all the rules and regulations of Part 95.

Well you just raised more questions than you will get answers, and then you'll get more personal opinions than facts. Lets face it a well intentioned opinion is still shit when it comes from an ass, and there is plenty here. My personal favorite for a base radio is the DX 2527. My first pick for a mobile is a toss up between an OLD 2950, HR2510, or Dx 88hl (galaxy.) Any way for what it's worth that is my opinion, and I own all of them. I've tried allot of the others, still own some, but those are my favorites. Good luck and Happy Hunting....

Kevin,

Well, I agree with you on almost everything. What if it's the guy next door that's the culprit and not myself?

Going into a hypothetical, we both use our sheds as radio rooms, and they're side by side on the property line. Can the FCC (or anyone for that matter), determine which antenna is transmitting the alleged illegal activity or using the alleged illegal device? If they can, no problemo. If they can't, well then the FCC could pursue actions against the wrong individual.

The best solution, of course, is not to have any illegal equipment and not engage in any illegal activities. Of course, if the guy next door is doing something illegal and the FCC knocks on my door instead, then what?

The price is a little high for a rig that is 2 generations old. You can buy
a new IC-2100H of TM-261A for $199.95 and get a year warranty. Besides
none of the will work on 27 MHZ.

So they search both sheds. If yours is the one with the linears, etc then you're in trouble. If it's your neighbor then he's in trouble. Simple as that. The FCC can use recorded data, oscilloscope readings to determine which radio (with or without a linear attached) was doing the transmitting. Since all modern CB radios use phase locked loops it is pretty easy to track down a culprit. Every radio has its own "phase in" signature. So if it's your neighbor it will be pretty easy to determine that. If it's you it will be pretty easy to determine that too.

> Well, I'm glad you have this issue all worked out. Perhaps you should share
> your legal opinions with the attorney general.

The Attorney General doesnt know her ass from her elbow. Just look at Waco, Ruby Ridge and similar situations. Just because something is an Administrative law somewhere doesnt means its Constitutonally correct. Something only becomes "Unconstitutional" when its gone through the court system up to and including the Supreme Court. Until then its just another societal guideline.

>Perhaps you should present case
> law as well.

I dont have to because there isnt any (yet). When the FCC practically abandoned enforement 13 years ago the only major problems in the private (non-commercial) radio sector were with CBers. Any CBer who was caught did not have the financial resources (or the gumption) to fight the FCC so there was never any case law ruled upon. Now its 13 years later and some Hams have become a problem (jammers), and "organized" government enforement has just resumed. There are those within the Amateur Community who have the financial ability to fight the FCC, hence case law will eventually be written. Just wait until W1WCR and his crowd get going. They will be going balls to the wall with the FCC.

> The FCC will never enter a home if there is no evidence of radio transmissions
> coming from the structure. If there is evidence, then said evidence is
> reportable to a court of law if needed.

Any, and I mean any electronic evidence is practically inadmissable in a court of law. This situation is exactly like a wire-tap. A taped wire-tap alone cannot be used as justification to convict. A wire-tap along with WITNESS corroboration is the only thing that is acceptable. The conversation on the wire-tapped recording is used to "set the stage" and can only corroborated by a cooperating persons testimony.

>Beyond that, if there is evidence of
> transmissions, they have a legal right to inspect.

They do not have the right to inspect. There administrative rules say they have a right to inspect however they do not possess the right to enter a property without a court order. Many of them have been getting away with rapping on someones door, and that individual has let them in, but without a Search and Siezure Warrant (which has to be issued by a Federal Judge) they cannot legally enter ones domicile.

>Beyond that, all questions have been
> addressed regarding the equity of the fee amount, so the NAL's are sticking.

The NAL's are sticking because the defendants arent fighting them.

> side by side on the property line. Can the FCC (or anyone for that matter),
> determine which antenna is transmitting the alleged illegal activity or using
> the alleged illegal device?

This is exactly the reason why the FCC needs a physical witness to corroborate the electronic evidence. They cannot go busting in to a house violating your civil right to enjoy your real estate because you may in fact NOT be breaking the law.

Your hypothetical situation reminds me of the Connecticut State Police. Some years ago they decided that they had the right to use a seldom used State Motor Vehicle Administrative Law as justification to set up random road blocks on New Years Eve in order to catch drunk drivers. They detained and tested 100's of innocent people who were not drunk thus violating their Civil Rights.

Someone guy with big Onions sued them and took the issue all the way to Connecticut Supreme Court of which the State Police walked away very embarrassed.

The FCC cant trample on the rights of law abiding citizens by "taking a shot" that they'll catch a bad one. In the situation of 2 individuals living next door to each other, they would have to wait until they actually had a breathing witness who was willing to testify or one of the parties would have to volunteer to have their station inspected in order to eliminate his station from the equation.

The point is at what point are you deemed to be keying a mike? Isn't
it the FCC's responsibility to show evidence of this before any Part
95 rule can be applied? If you are not keying, and the FCC does
not know for certain that you have a CB, then you are not a CB'er,
and no part 95 rule applies to you. Specifically the inspection rule.

I'm sorry for being incomplete....not just oscilloscope readings. Although oscilloscope readings can be used to determine oscillator characteristics there is what is called "fingerprinting" that uses "oscilloscope type" readings to look at the phasing in of the oscillator. Every radio is slightly different due to the different component characteristics.

>can also hear it on USB and LSB.

This is correct. When you tune to the AM signal (called zero beating)
you will be able to tune in AM and understand what is being said. It
does not matter if you are on lsb or usb. It works the same way.

> Conversely, if I hear a conversation on
>LSB I can also hear it on USB or vice versa. Is this a normal occurrence
>for SSB radios?

Yes it is normal but you can not understand lsb when you are on usb
and vise versa.

>The manufactures advertise that you can use 120 different
>channels with a SSB radio but from what I am hearing on my unit there are
>still only 40 channels.

40 is all. For example channel 40 is considered to be 27.405 mhz

AM = 27.402 - 27.408
LSB = 27.402 - 27.405
USB = 27.405 - 27.408

LSB and USB are components of an AM signal.
The other component of a AM signal is the carrier centered at 27.405

All of these modes can be intercepted by a receiver that is tuned to
the correct frequency. When you take your clarifier and tune lsb to
a area above the normal 27.405, you will then start to invade the
usb portion of this channel. When you do this you will hear a
unintelligible usb signal if one is present.

>Any help is appreciated.

It is a three wire. The tip is the PTT, the ring is the mic terminal, and the
sleeve is ground. Use the mono 1/4" plug.

i don't know about refurbished radios but i bought an SWR meter for my mobile. It was a PDC 5 cuz i just wanted somehting small and compact. But i got it and the package was all damaged liek it was opened b4 i got it or like someone had it and returned it b4 i got it. I hooked it up and it didn't work. And there were 2 knobs missing on it. I'm kinda thinking that they do sell refurbs or products that people sent back and were never fixed. You should try Thomas Distrubuting out of Paris, IL. They have better quality products. They are a little more expensive than copper but its worth it. They have mod and conversion kits too.

Use between a 45 and 100 ohm, About a 60 ohm if you use a roadking 56, and around a 100 ohm for a stock mic, up to around a 200 ohm for a power mic, Also you can solder a resistor from pin 4 on the backside of the mic plug to board ground (square metal can) and simply switch the wire in and out of the circuit for switched talk back.

Good Luck!

Just depends upon who you need to talk to. On flat land with open spaces, 2 meters can go 60 miles or so with a little luck--40 for sure (assuming 50 watts). 6 meters is also useful in this range but the equipment is a bit scarce. Actually a bug catcher would probably put out a better signal for 11 meters than most CB antennas, but I doubt that too many guys have tried to use one for that.

Your radio is operating correctly,where did you see 120 channels? Galaxy and Copper use such idiotic numbers but I expected more out of Uniden. By the way if someone is talking on SSB and you are on AM you will not understand them unless you are physically very close.

Before ordering from any internet or mail vendor, I check out what folks on Usenet are saying about it. The search facility is use for this is http://www.deja.com.

Based on what I read there, The Rebate Company appears to be a legitimate outfit. However, as with any internet company, questions can be raised about how profitable it is and thus how long it will remain in business.

Also, read what they have to say at http://www.rebateco.com/info.html. Taking their words on that page literally, I interpret the Rebate Company as committing themselves to pay the rebate out of their own funds if the manufacturer renegs. Pretty impressive, if true. As for how long it takes to get back the rebate, the page last mentions advising the Rebate Company of a problem if the rebate has not been received after 14 weeks.

Steve Eisenberg Wynnewood, Pennsylvania U.S.A.

P.S. Thanks to all for the many informative replies to my original post in this thread. However, I still have not seen any recommended model numbers of cheap, not too heavy, center load telescopic CB antennas. All suggestions are welcome. Please don't hesitate to respond just because of not knowing how your favorite cheap center load telescopic can be fit onto a GE handheld--I can probably rig up an adapter myself if need be.

Hello, all;

I have a few things for sale. E-mail me if you, or a friend, are interested. Here goes:

1.) Sadelta Echo Master Pro desk mic. Controls for modulation, echo volume, echo speed, roger beep on/off. Modulation meter. Great sound. Excellent condition. $55+ shipping.

2.) PDC antenna switch. 3-positions, 1500 watt rated, never used. $20+

3.) Hustler mobile antenna. Base loaded coil. Med. duty spring/36" stinger. Needs mount. $15+

Write to manmusic@earthlink.net Thanks for looking. Pat

Of course, they have to prove you have a CB in the first place. The mere presence of an antenna on your roof doesn't mean you have a CB. Let them prove it before you show them anything.

>are probably rather lossy. So what's the magic frequency where
>you get the best bang per watt?
>
There is no absolute magic number of a frequency, but there are two limits that I use as a guideline when discussing radio communications theory. The lower limit is the 40 meter band. 40 will work local stations on out to several hundred miles during the day. All this on a hundred watts SSB using an 8ft antenna mounted on a rollbar. At night the range extends to thousands of miles, subject only to static and interference from foreign broadcasters.
The upper limit is 20 meters. 20 will work from a few hundred miles on out to 12,000 miles. The noise level is lower, and antenna size is still 8ft overall. 20 is terrible for local chats, so for that it's back to 40. This is where ham operators have a much better shot at a usable frequency, because we can move up or down on the bands as ioniospheric conditions change. My mobile (100 watts, ssb) can operate from 80 meters to 10 meters. Contacts range from local, to Russia, China,and more than a hundred countries on various bands. At home I cover the same bands, same power level, but have some bigger and better antennas.
My favorite band? Has to be 10 meters. When it's open, 5 watts will talk anywhere in the world, clean and clear. I like building antennas, and 10 meter stuff is small enough to fit almost anywhere. And you can cut down CB antennas to work great on 10!!!

Ditto! This is the best response of all of them. Only thing I would add is that the "perceived SWR" is affected by coax length but that has nothing to do with actually changing the reflected power back to the transmitter. The best length is 1/2 wave length including consideration for coax velocity. At 1/2 wave length you will see the actual SWR as it exist at the antenna feed point.

Gary Danaher wrote:

> First, it is swr, not swr's.

Gary Danaher wrote in message > Actually a bug catcher would probably put out
>a better signal for 11 meters than most CB antennas, but I doubt that
>too many guys have tried to use one for that.
>
Gary: a bugcatcher (or screwdriver for that matter) is a quite lossy antenna when used on 10 or 11 meters. Shorted turns in a big coil on the bugcatcher create LOTS of loss. Try it some time using a good Field Strength meter at a 1000 ft distance.
My 10 meter mobile antenna is a 7/8 inch by 102 inch long aluminum tube, using a custom mount with a 1/2 inch bolt. It's big, ugly and tall (13 ft overall height.) BUT there are no coils, traps, gadgets, or do-dads to reduce performance. Bandwidth is from below 27 to 29 Mhz at less than 2:1 swr. And will handle the full legal output available to me of 1500 watts, if I need it!!!

You wont need an amp if you have a Good antenna, Like a Wilson or a K40.
One thing is make sure its got a good match to the radio, for best output
strength and signal should also be good for the others. A good radio if you can
find it for not to much money is the Cobra 19 Ultra. I had one and its a GOOD
little Radio!!

And for the classic shortwave experience there's always CW. 10,000 miles on 100 milliwatts is not very difficult.

<<< There is no absolute magic number of a frequency, but there are two limits that I use as a guideline when discussing radio communications theory. The lower limit is the 40 meter band. 40 will work local stations on out to several hundred miles during the day. All this on a hundred watts SSB using an 8ft antenna mounted on a rollbar. At night the range extends to thousands of miles, subject only to static and interference from foreign broadcasters.
The upper limit is 20 meters. 20 will work from a few hundred miles on out to 12,000 miles. The noise level is lower, and antenna size is still 8ft overall. 20 is terrible for local chats, so for that it's back to 40. This is where ham operators have a much better shot at a usable frequency, because we can move up or down on the bands as ioniospheric conditions change. My mobile (100 watts, ssb) can operate from 80 meters to 10 meters. Contacts range from local, to Russia, China,and more than a hundred countries on various bands. At home I cover the same bands, same power level, but have some bigger and better antennas.
My favorite band? Has to be 10 meters. When it's open, 5 watts will talk anywhere in the world, clean and clear. I like building antennas, and 10 meter stuff is small enough to fit almost anywhere. And you can cut down CB antennas to work great on 10!!!>>>

I have 2 2950s. I have never had a radio report say I have white noise in my signal. Probably your D104. That is a very sensitive mic and it is probably picking up noise. Your antenna has nothing to do with the noise. Do you still have the stock mic? You might want to ask for a radio check comparison using the stock mic. Have any mods been made to the radio? I wouldn't do any of the advertised mods except for adding a clipping speech processor. Let me know if I can help more.

Exactly! Then you could be bored to death reading all those BS contest results, and looking at photos of rich people's Ham shacks! Of course, this is how QST manages to stay THICK, while all the other Ham rags are getting thinner and thinner! Take all that contest crap out, and the damn thing probably would be about 1/8 inch THIN! I worked, and confirmed all 50 States on 40 meter CW, many years ago. I sent ARRL a letter, (before they had E-mail) and asked them how I should go about getting my 'WAS' award...You know what they said? "OUR RECORDS SHOW THAT YOU ARE NOT A "MEMBER" OF ARRL. ONLY MEMBERS ARE ELIGIBLE FOR THE 'WAS' AWARD"...Then it went on with the "WHY DON'T YOU JOIN" BS, etc...They didn't even bother to explain how to get the award, even if I DID "JOIN", (buy QST, in other words). So, as far as I'm concerned, ARRL=BS... Joey

Hello Gary: I'll say this again "Now that's one I would like to see"

Gary Danaher wrote:

> Jay, this is not brain surgery.

Agreed, but it ain't like falling off a log either. Any time Electromagnetic Measurements are taken, there are always variables that can and will throw a monkey wrench in the gear box. That result in bad measurement data. This where a experienced technician or engineer need to be aware of the these variables.

> DFing a stationary signal is very easy to do and with modern technology, fingerprinting
> a signal is a snap.

I am familiar with Radio Direction Finding (RDF). And there are times you can very accurately detect a transmitters direction, with the Angle Measurement Equipment (AME) function, and there are times it will leave you in deep left field without a clue. If you believe the RDF's accuracy in the AME, and you have experience with the equipment, and know the range equation, (or just the free space loss of a signal, and the 6dB double/half range octave fact) you can get very close with the transmitters location, via the AME and a estimated distance.

"fingerprinting a signal is a snap" I'd love to hear about fingerprinting a signal. Please do tell.

> DFing a mobile signal is more
> challenging, but if you have 2 or more guys doing the job, anyone can be found.

Ok.But using your low tech equipment to detect a transmitting antenna, among a group of antennas, across town, and then detecting and identifying the transmitting antenna, that is within other antennas, as close as 4 feet apart..... Like I said, I'd like to see that!

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

A "perceived match", as you call it, which would be indicated by
placing the swr meter at the radio instead of at the antenna, DOES
indicate the reflected power to the transmitter. This is not a
fictitious reading. True, it may not be an accurate indication of the
antennas as a load by itself, but it does indicate the total of all
the factors that go into creating a proper load for the transmitter.

Yippee!!!! After forgoing radio comms for over a year due to my busy life and theft of my last 2510, I today purchased a President Lincoln. One thing I notice different then the schematic is that it's now using a mrf455 final, moved to the underside of the main circuit board, with the original driver transistor in its original spot. Is this new?...or is it just the difference between the 2510 and the Lincoln? Also, I don't think the mods could get any easier....(oh wait, it could be as easy as a 2950, but diffference is.......this radio WORKS... <g>)
Any thoughts?

Greetings Gang,
I need help/info on a Golden Eagle 750...I took it the shop today
and found out the plate xformer is out..Mike thinks it's 700volt at 1.25

amp but isn't sure..I need to make some inquirees and find out..It has
(2) 20LF6's driving (4) 20LF6's..IP meter goes to 1000ma..Does anyone
have the xformer ratings or know what they are? .Whatever it is 700v or

whatever, it'sCT. RD, my neighbor has a schematic for the GE1000. It has

(2)20LF6's driving (6) 20lf6's and has a low/high stage..Low is 500v and

high is 1000v..Anyhow , this is a nice amp and I plan on keeping this
one..
The xformer leads are plug in.It reminded me of removing a Alpha
xformer..
Thanks ...Rusty

Well I don't know about location but every where I been that has had testing it is a single fee per session. Most will give at least two test for one fee. On several occasions I've seen people go from non ham to general at one session for one fee. ARRL got nothing in most that I have seen because it was different organizations doing the testing.

One other thing what does that have to do with CB?

If you are an amateur when you applied for your ticket you gave the FCC to inspect your station, no warrant needed.
If you operate a CB that is different, but it would be a lot easier in the long run just to let them in and say you didn't know any better and cut your losses.

<>>

All this hoo-hah about nothing. Amateurs have lived with
the FCC's "right to inspect" for decades -- without protest.

The only ones that squawk about it are the troublemakers
(who stand to lose if they are inspected).

761. Re: Swr's

Newsgroup: rec.radio.cb
Date: 1999-08-07 00:00:00 UTC
From: jdaggett@gate.net
Message-ID: <37abb82a.19245516@news.gate.net>
Source record: 761

On Fri, 06 Aug 1999 14:40:00 GMT, Gary Danaher <gdanaher@flash.net> wrote:

*First, it is swr, not swr's.
*
*Second, the length of coax has virtually nothing to do with the actual
*swr of an antenna-radio match. Trying to simplify this, a particular
*radio frequency will be perfectly resonant on an antenna whose electrical
*length is the exact length of the frequency's wavelength or a particular
*fraction thereof, e.g. 1/4, 1/2, 5/8. That said, if the antenna length is
*too short or too long for this particular frequency in question, the swr
*will rise. In a base station situation it is fairly easy to create an
*antenna which has totaly flat swr (1:1). In a mobile it is sometimes a
*challenge but is achievable. The location of the antenna on the vehicle
*to a great extent determines the swr. It interacts with the metal
*structure. Given your particular situation, it may not be possible to
*have a flat swr on a vehicle but it doesn't have to be perfect to work
*well. A 1.5:1 isn't bad.
****

The length of coax has no effect on the match between the antenna and the feedline. Length of coax will play an effect on the match between the transmitter and the feedline if the antenna is not the same impedance of the transmission line. By adjusting the length of the feedline one can reflect the impedance of the antenna such that it will match the desired impedance of the transmitter. However from a system point of view this is truly not an optimal practice. This is because the SWR still exists at the antenna. It is more desirable to adjust the length of the antenna to obtain a suitable match or introduce a matching circuit composed of lumped constants, ie inductors and/or capacitors, to obtain a match between the antenna and the feedline. This is the most critical junction. This is where most of the power is lost.

For mobile installation, the more metal of the car body under the antenna the better. This will allow the ground losses that are associated with mobile installations to be reduced. In mobile installations the ground losses can approach a significant portion of the radiation resistance of the antenna. In short vertical antenna the ground loss resistance can even exceed the radiation resistance of an antenna. Thus making the ability to match the antenna very difficult.

Agreed that a 1.5:1 SWR is adequate. The difference in radiated power from 1.5:1 tro 1.0:1 is minimal.

Regards
James

*Remember that the higher the frequency, the shorter the antenna. Check
*the swr on Channel 1, Channel 20, Channel 40. See if it goes up, down,
*whatever, and figure out where it is most resonant and if it isn't, where
*you want it to be and adjust the length accordingly. Be aware that an
*open door or trunk lid will affect the swr.
*
*Mobile antennas use the structure of the vehicle as a ground plane. It
*might be necessary to move the antenna to a different location on the
*vehicle to achieve a good match.
*
*Most antennas have provisions for making adjustments. Avoid cutting on it
*until you have determined it is a last resort.
*

*
*A "perceived match", as you call it, which would be indicated by
*placing the swr meter at the radio instead of at the antenna, DOES
*indicate the reflected power to the transmitter. This is not a
*fictitious reading. True, it may not be an accurate indication of the
*antennas as a load by itself, but it does indicate the total of all
*the factors that go into creating a proper load for the transmitter.
****

Essentially the coax length adjustment is a means of matching the transmitter to the feedline. It does not do anything for the feedline to the antenna match. When dealing with systems where the antenna and/or the treansmitter are not the same impedance as the transmission line, you have two area to match. The transmistter to the feedline and the feedline to the antenna. The later is more difficult.

Regards
James

*> The
*>best length is 1/2 wave length including consideration for coax velocity. At
*>1/2 wave length you will see the actual SWR as it exist at the antenna feed
*>point.

*
*>I recently entered into the world of SSB operation by purchasing a Grant LT.
*>While playing with it today I noticed that if I hear a conversation on AM I
*>can also hear it on USB and LSB.
*
*This is correct. When you tune to the AM signal (called zero beating)
*you will be able to tune in AM and understand what is being said. It
*does not matter if you are on lsb or usb. It works the same way.
*
*> Conversely, if I hear a conversation on
*>LSB I can also hear it on USB or vice versa. Is this a normal occurrence
*>for SSB radios?
*
*Yes it is normal but you can not understand lsb when you are on usb
*and vise versa.
*
*>The manufactures advertise that you can use 120 different
*>channels with a SSB radio but from what I am hearing on my unit there are
*>still only 40 channels.
*
*40 is all. For example channel 40 is considered to be 27.405 mhz
*
*AM = 27.402 - 27.408
*LSB = 27.402 - 27.405
*USB = 27.405 - 27.408
*
*LSB and USB are components of an AM signal.
*The other component of a AM signal is the carrier centered at 27.405
*
*All of these modes can be intercepted by a receiver that is tuned to
*the correct frequency. When you take your clarifier and tune lsb to
*a area above the normal 27.405, you will then start to invade the
*usb portion of this channel. When you do this you will hear a
*unintelligible usb signal if one is present.
****

tnom:

Good analogy. In communications the term channel is loosely defined as the
medium in which intelligence is transmitted. Thus in the nature of good
marketing let us tripple the number of channels for a SSB/AM transceive. They

are by the loose definition of a channel somewhat correct. By stating the LSB and USB are different channels is loosely correct. They seldom really explain that the 80 channels that y ou get with SSB have to coincide with the 40 AM channels. In this aspect the 120 channel advertisment is very misleeding.

Regards
James

*>Any help is appreciated.

In theory, I would agree with you, these devices are less than useless as a means of speech processing. But you must remember that the overwhelming majority of these 'echo' mikes, boards, boxes, etc actually DO have a legitimate use. Properly adjusted, they can (and do) provide a rather enjoyable enhancement to communication. Trouble is, I rarely hear one that is properly set. Instead, 90-95% of every one I have ever heard in over 25 years of CB has been cranked up to the point of unintelligibility. I have never understood why so many people, particularly truckers (of which I was one for a while) seem to find that 'good buddy' sound so desirable. In my opinion, they sound like a Mexican radio station. As a final comment, let me add this: It has been my experience that most anyone who ever used such a device seems to sound EXACTLY the same way, i.e. possess that 'twang' in their voice that would indicate, shall we say a southern or rural point of origin. So prevalent is this practice that for about the first year of my trucking life I was convinced that the same person was following me all over the country!

I don't claim to understand the reasoning behind the use of these devices as we know it today. My best guess is that many operators have a 'more is better' mindset when it comes to these things.

That's my dimes worth.

Phil

The FCC can inspect your station at ANY time. Its in the part 95
rules. Even if your perfectly legal!

I don't think this means they can search your home without a search
warrant, which must be issued by a judge.

Does your radio have NB/ANL built in? If it does turn it on. If
not, then your cars electrical devices are causing all kinds of RFI.
It may be a job for the dealer. Ask them if there is a service
bulletin for you make. They may have a fix for it.

>occasions I've seen people go from non ham to general at one session for one
>fee.

I'm afraid you MISUNDERSTOOD what I wrote Stan, but this really doesn't surprise me, as this IS a CB NG...I was talking about additional TESTING FEES for applicants that 'FAILED' the test! Notice that I mentioned "WAITING to try AGAIN"! I made no reference to applicants taking tests for HIGHER CLASS, after PASSING the lower class test!

>ARRL got nothing in most that I have seen because it was different
>organizations
>doing the testing.

I didn't say anything about ARRL getting anything from testing sessions, either! I was talking about the content of their RAG, and their rules about awards...I don't know what you read, but I think you need to read it again!

>One other thing what does that have to do with CB?

It has NOTHING to do with CB radio. And being that it doesn't, what provoked you to either READ it, or try responding to it? It was a response to a question someone asked on this NG...You know, it is that kind of attitude that keeps MOST CBers where they are at...Joe

The guys that buy echo mics are the ones that have a few bucks left
over at the end of the month, and rather than buy the old lady a new
vibrator, they figured they'd splurge on a new echo mic.

>The FCC can inspect your station at ANY time. Its in the part 95
>rules. Even if your perfectly legal!

Part 95 rules deal with people that have a CB station. Does your
neighbor have a CB station? How about your uncle? The point is
that in order for part the part 95 inspection rule to come into effect
the FCC must know you have a CB or are transmitting. They do
not have a right to search your uncles house.

791. Australian CB newsgroup??

Echo mics and noise toys appeal to those with a 12 year old mentality.

797. 6dB or 9dB ?

Newsgroup: rec.radio.cb
Date: 1999-08-07 00:00:00 UTC
From: Bobby D <bobby_d@mpx.com.au>
Message-ID: <7oh8igsst1@news1.mpx.com.au>
Source record: 797

I have just had an GME TX3000 fitted in my car today, it came with a 6dB and a 9dB antenna, the area that I live in has undulating ground and only 1 mountain range about 60 km away with a repeater station on it and today I was able to pick it up quite easily with both antenna's....

So which one would be the best for this type of undulating land the 6 or 9 dB antenna??? I have had it mounted on the side of the bonnet...

Cheers.... Bob

798. Problems? in '99 Tacoma

Newsgroup: rec.radio.cb

Your best bet is to use a larger alternator .There are many companys out there that make direct factory high cap.alternators for all brands.You are only doing 400 watts so you could up grade you present alternator without the trouble of adding a second alternator.Powermaster makes 200ampers direct bolt in's for all american cars and stinger makes nice 200ampers for the jap cars.Some people run a bank(6 or more) of large 1.5 stiffing caps in place of batterys if you have enough alternator. Take care 1200~~~~!~~~~

these are called stiffening caps.
the general rule of thumb for AUDIO amps is 100,000 uFD per 100 watts output.
i'm not sure what the formula would be for rf amps but i would guess it would
be the same if you were transmitting ssb as the caps. only work for peak bursts
of power output/draw.
if you are transmitting am, the caps won't help you as the amp will draw the
caps. down and keep them down as long as you key up with the constant load of
the amp.
if you are talking fm, the same holds true.
if you only talk am or fm, you may want to look into a bigger power supply or
alternator.
good luck.

Just to clarify a point. There is no waiting period to re-test for a failed test.
As long as the examiners have a new test to give you they can re-test the
applicant. I agree that my statement "non ham to general" may have been misleading.

I have one newcomes never been out of the box, only used
once. In perfect shape, minor crack in display. It's a real
steal, I'll sell for $350.00 plus shipping inside the CONUS.
Paid $169.95. You better hurry and get this before you read
it.;-)

>will use them in addition to their ham setup (I am in the second group).

One reason is that family members are unlicensed and can utilize the ham gear.
CB and FRS are ideal for keeping family activities coordinated.

That would be redundant; there are others already posting such information
(and I'm glad such postings appear).

>More Hams than CBers have gotten busted since Riley got hired.

I believe the FCC is targeting hams over CBers for a variety of reasons:

*The trouble-makers are an embarrassment to the US and jeopardize US
spectrum allocation within the ITU;

*Amateurs are entrusted to be self-policing -- when that trust is
violated, it hurts all hams and casts a shadow over our 100-year history;

*Amateurs have been tested on regulations and are supposed to meet
(minimal) international standards, thus we're held to a higher standard
of operation than CBers; the trouble-makers are fully aware that they're
in violation of the law, yet flaunt that fact -- the interference they
cause is intentional which makes them an inviting target for the FCC;

*In many cases the trouble-makers have been fingered by law-abiding
amateurs, so the FCC already knows their identities and locations.

>Why aren't you posting than little tidbit of information?

Again, anytime a ham gets busted, there are more than enough notices
posted on here (usually in the form of an illegally reproduced ARRL
bulletin). But it looks like Newsline is back, so that will be an
additional source of FCC activity against trouble-makers on the ham
bands.

>It seems that the only time you post to the CB newsgroup is when a fine is
>levied against a CBer (which is rare) or when you feel CBers should be
>reading the Part 95 Rule and Regulations, which you place a FAQ in front of
>the posting.

That's part of my monthly FAQ posting sequence. Glad to see you're reading
that stuff. Emails regarding the posting of the CB rules have been
favorable.

>Were you hired by the U. S. government as the official FCC
>media spokes person?

Nope. Just one of the rec.radio Usenet FAQ volunteers, trying to make these NGs a valuable source of information. Want to join us?

>Please enlighten us.

I hope you're enlightened now.

But you're correct -- I don't hang out on rec.radio.cb, for most of what I hear on the CB band is embarrassing. Many of the operators talk in such a strange manner, screaming into their mics saying all sorts of weird things. I do have a CB on my sailboat (along with a VHF marine band radio) -- we have a large fishing fleet here in the islands (operating on Channels 22 and 23). There's always a fishing boat within hailing distance in case assistance is needed (and fishermen don't scream and say weird things on the air -- their conversations are of a normal manner).
(At the same time, if a fishing boat goes aground on a reef, you can be sure pleasure boaters who are able to assist will respond; these waters can be dangerous so everyone helps everyone else.)

Jeff KH6O, posting from rec.radio.amateur.misc, not rec.radio.cb =:o

The FCC has introduced a new testing requirement for all internet users.

If you own a personal computer and you don't want to access the internet, then you can use your GUI based operating system without taking an passing any tests.

However, if you are going to be logging on to the internet you must learn TCP/IP and be able to issue at least 5 commands per minute to a command line interface style operating system.

Makes about as much sense as requiring people to know 5 WPM of CW to talk phone.

You have to be a CB'er in order for a part 95 rule to be used!!!!!!!

In other words the FCC has to has solid knowledge of your ownership of a CB radio. Or knowledge of a transmission.

In other words again, let's assume your neighbor does not own a CB. According to you then.....

" A Station Inspection can happen at anytime at the FCC request. If you don't give permission as per Part 95, then you can be fined. Then it would be up to you to prove your innocence in a Federal Court of Law. Good luck!"

Tell that to your neighbor when the FCC wants to enter his premiss.

Source record: 882

Greetings Gang,
I need help/info on a Golden Eagle 750...I took it the shop today and found out the plate xformer is out..Mike thinks it's 700volt at 1.25 amp but isn't sure.. It has (2) 20LF6's driving (4) 20LF6's..IP meter goes to 1000ma..Does anyone have the xformer ratings or know what they are?
The transformer is center tapped. RD, my neighbor has a schematic for the GE1000. It has (2)20LF6's driving (6) 20lf6's and has a low/high stage..Low is 500v and high is 1000v..Anyhow , this is a nice amp and I plan on keeping this one..The xformer leads are plug in.It reminded me of removing a Alpha xformer..
Thanks ...Rusty

I saw either DaveMade page or X-force was going to be offering cap banks you may mail them and see how they are coming with their work in this area. These caps have been successful with the instant peaks in audio systems such as a sub woofer hitting a low. I think the cost is considerably more than an alternator/battery upgrade. A 100 amp alternator, good battery and minimum 8 gauge wire/good grounding should handle the power levels you are speaking of. 400 watts peak should be drawing about 30 amps.

Did you guys know that the echo effect on rf signals increases the range by 20 miles? And with an A-99 maybe even 30 miles? But wait that's not all..... if you act now you can learn the hidden secrets on how to turn all knobs that say "gain" on the mic and radio wide open. Add side band to it and you can talk all the way around the world and back to yourself. This is the best way since nobody else will talk to you.

>not have a right to search your uncles house.

You may want to read this:

"7. Under § 303(n) the FCC has the "authority to inspect all radio installations associated with stations required to be licensed by any Act, or which the Commission by rule has authorized to operate without a license under Section 307(e)(1)." 47 U.S.C. § 303(n). This definition expressly includes CB radio stations as those that the FCC is authorized to inspect. Likewise, under § 95.426, "[i]f an authorized FCC representative requests to inspect your CB station, you must make your CB station and records available for inspection." 47 C.F.R. § 95.426(a). Thus, an FCC agent does not need a search warrant to inspect a radio station. See Norfolk Southern Railway Company, 11 FCC Rcd 519 (CIB 1996) (the right to inspect a station is one of the cornerstones of the FCC's ability to ensure compliance with the Communications Act and the Commission's Rules). Pursuant to 47 C.F.R. § 95.402(a)(1), Mr. Farlow, as a CB operator, had the responsibility to be familiar with the CB rules and to comply with these rules. "The Commission expects its licensees (including CB users authorized by CB Rule 4, 47 C.F.R. § 95.404, to operate without an individual station authorization) to be familiar with those rules that govern the class of station they operate. Claims of unfamiliarity with rules cannot be used to justify mitigation of penalties." William J. McCray, Jr., 9 FCC Rcd 1897 (FOB 1994). As such, the violations of § 303(n) and § 95.426 were willful.[1] "

>because they'll just spoon feed more of their bogus BS.

I guess the real question is how many hams have CB radios or have had in the past?

To a lot of hams that came after 1959 the answer to that question would be Yes.

CB was and still is a inexpensive radio service that most hams have tried and either put up because they found that it was too limited, too noisy or too many people spewing four letter words. Other hams still use CB radios will use them in addition to their ham setup (I am in the second group). My own personal view as a ham and a person that likes radios is that CB is another radio that I have access to use. I dont usually monitor it but do bring it out on occaision to chat with others. I also view Family Radio Service in the same light and I am waiting for prices to settle there before getting a pair of FRS.

Hey Jeff, I dont see you posting information on the Ham newsgroups every time a licensed Amateur gets busted.....what gives. More Hams than CBers have gotten busted since Riley got hired. Why aren't you posting than little tidbit of information?

It seems that the only time you post to the CB newsgroup is when a fine is levied against a CBer (which is rare) or when you feel CBers should be reading the Part 95 Rule and Regulations, which you place a FAQ in front of the posting. Were you hired by the U. S. government as the official FCC media spokes person?

Please enlighten us.

> The FCC can inspect your station at ANY time. Its in the part 95
> rules. Even if your perfectly legal!

You are confusing what is law and what is not. The FCC does NOT have the "RIGHT" to enter anyone's home without a FEDERAL WARRANT. The FCC can ask to INSPECT a station of a CBer. If that CBer refuses they can go in front of a judge with criminal evidence and tell the judge that the CBer refused an inspection.

If that judge decides that the CBer refused the inspection, and based upon the FCC's evidence presented to him, then a warrant can be issued. It is at this point the the FCC has a "RIGHT" to enter the dwelling to inspect the station.

Using a CB radio does not give the FCC the "RIGHT" to enter someone home. Using a CB gives them the right to "INSPECT" which is to very different things, which have different results.

From: pencilpusher@my-deja.com
Message-ID: <7ohqco$8k3$1@nnrp1.deja.com>
Source record: 916

I noticed when my amplifier peaks at over 400 watts, the voltage drops to around 12 - 11.5 volts. Has anyone ever considered using one of those large capacitors used in car stereo sytems (ie."Street Wires" and "Phoenix Gold")? The capacitors are rated at a maximum of 20 volts. Does this mean they supply a constant 20 volts, or whatever your maximum output is on your vehicle's electrical system (ie. 14 volts). How large of capacitor would I need to sustain 14 volts at a 50 - 60 amp draw? The capacitors come in 1/2, 1, 1 1/2, & 2 farads.

Source record: 925

What's not fair about Part 95? Because it doesn't let you run just as much power as you want? Because it doesn't let you modify your own equipment as you like? Because it doesn't allow you to transmit on any but the allocated 40 channels? It's there to protect the services along side of CB like ham, medical, and control equipment that use the area around 11-meters.

The rules regarding skip and power wouldn't be needed on UHF but since CB was meant to be a LOCAL means of commination and skip does occur on 11-meters the rules had to be put there because the FCC KNOWS that if the rule wasn't there people would run just as much power as they wanted and would try to talk to other states, interfering with that areas LOCAL communication. Not that the rules have stopped it now....

The reason that 11-meters was chosen back in the 1950's was because UHF and VHF equipment was extremely expensive to make. There were no UHF transistors back in the 1950's and very few would work up into that range. Those that would were EXTREMELY expensive.

If EVERYONE would use the allocated 4 watts output then 11-meters would be a much more civil place to communicate. It was back when I was big into CB in the middle 1970's before it went crazy. YES I know that 4 watts will still skip, I've talked all over the world on 5 watts using 10-meters but with very low signal strengths on the other end. An S3 or S4 noise level (skip noise) can be tolerated for local communication much more than an S9 noise level like what exists much of the time now. Yes when I got into CB there were those who ran 100+ watts. But when you turned on the radio you would hear one or two from other points of the country not hundreds.

Yes, I agree CB is the "lost child" of the FCC but it's not the fault of the FCC. If the FCC would have been able to charge $5 for a license it wouldn't have had to drop the license requirement in the first place because it would have had the funds. If Congress hadn't passed a law that said the $5 was "excessive" then the FCC would still have the funds to enforce the rules on the books. If the guy can't afford a $5 license fee that covers the entire family for five years then how's he going to afford $50 or $100 for a radio? The reason that a person can't get across town using a stock radio is because of all the other idiots out there running 50 or 100 or 500 watts so that they can get across town. It's a catch-22 type situation.

I agree that 11-meter CB is out of hand and should be dropped altogether. But what do you do with the five million CB radios that are out there now? Do you have a "trade-in" program or something? If Class D CB was "dropped" it would become more of an area of anarche than it is now. It's already been "dropped" anyway. That's why Congress is dropping it into the hands of the local cops.

(I wound up going out of town after placing this add last month - rather than attempt to respond to the old inquiries, I'm placing the add again...)

All equipment is in excellent cond and works fine - no surprises....

1. Drake R4-B receiver - xlnt cond - works fine - no known problems with MS-4 spkr (spkr has extra front headphone connector and indicator light) - $240.

2. Cobra 2000 Base radio - xlnt cond - works fine - still stock! very nice - with extra spkr - $350.

3. Cobra 2000 Base radio - xlnt cond very nice - slight transformer hum - transmits great - mod'd with extra freqs, echo & variable output - with extra spkr - $325.

4. Robyn GT-7C Deluxe CB (23 chnl) Base and mobile unit - works fine - mobile slips into very nice wood base unit for base operation (with clock). A sought after unit...$150.

5. RS Pro 90 Trunk Tracker Scanner - xlnt cond - with stock ant. - works fine - $100.

6. Grant XL CB - xlnt cond - works fine (with stock hand mike) - $100.

7. Hallicrafters S-118 SW receiver - xlnt cond - tube set - works well - $75.

8. Hallicrafters S-120 SW receiver - xlnt cond - tube set - works well - $75.

9. Texas Ranger 606F mobile CB - xlnt cond - works well with hand mike - (digital frequency readout) - stock - $125.

10. Two extra Cobra 2000 speakers) - xlnt cond - $50 each.

Will add more as I get time...

Inquiries welcomed -

John

Caps only purpose is for quick power surges. If the power supply for your amp drops only on the first word spoken then a cap might help, but if the voltage drops for the whole use then a cap won't help.

The voltage only drops off when it peaks at over 400 watts. There
should be sufficient power provided by an auxilery battery and 4awg
wire. Will the capacitor sustain the voltage during those peak output
bursts of modulation? I'm not sure, but isn't the re-charge rate of the
capacitors almost instantaneous?

I keep hearing the word search. The FCC conducts Station Inspections. A search requires one of 2 things: 1) Your permission or 2) a search warrant. A Station Inspection can happen at anytime at the FCC request. If you don't give permission as per Part 95, then you can be fined. Then it would be up to you o prove your innocence in a Federal Court of Law. Good luck!

You should point your browser to the fcc forfeiture page and read some the stuff stupid people do. A couple pirate stations--one from a college kid who said he would rather pay a fine than give up his transmitter--RIGHT!, and Taco Time, who after getting caught using an unlicensed transmitter to take orders, just changed the frequency and thought nobody would notice. Finally, the guy in Florida who ran a pirate station for 2 months. Told the agent that the guy he bought the equipment from had told him it would be ok, and that he could run that station until the fcc sent him a 'warning' letter. Yes, there was a cb operator who refused inspection of the house, and had a radio in his truck for which he also refused inspection. There should be an electronic Darwin award for folks like this.

Gary your technical incorrectness is starting to be most apparent. If your going to stir the pot here on the CB ng, then do it with whit, style, charm, class, and being technical correct is a must. Its like the channel agitator coming on the local CB channel with a weakie - squeaky mobile station, it just doesn't work. Maybe I can give you some pointers?

Hello Pencilpusher: I have heard that the large 1 Farad and larger capacitors, do seem to help a little on some amps. But I think that if you using SSB it may help some. But I wouldn't think so for AM. Might be worth a try, ah?

The double edged sword here is that when the amp draws a lot of current for a instant, as it will on SSB, then the capacitor will try to maintain the higher voltages, for the amount of time it has in its charge, but then then capacitor will take current to charge itself back up to its original charged state.

What is the current rating of your alternator?
What size wire do you have feeding the amp?

The real way to keep the voltage up during a high current draw time, is to have a high current alternator, and at least 4 or 2 gauge wire running from the battery to the amp for both positive and negative. And even then your gonna see some voltage drop. Some of the Big Straps have a separate alternator to power the amp.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

This is fine and dandy but the whole thing is prefaced on inspection
of radio station. What makes a radio station? How does the FCC
determine you have a radio station?

If i was a electronics repairman and/or electronics enthusiast and/or
electronics collector does that mean i have a radio station? Does that
mean my house is open for inspection? It does not.

A radio station is one that transmitts and/or is licensed (amateur) or
unlicensed (CB). One of these factors has to be known to the FCC
before they can enter a premiss.

Jay,
I don't plan on writing a dissertation for every problem some guy has here, nor should you. The question simply implied that when he keyed up, that the voltage would drop and stay there, and he was wondering if a large capacitor would help, which in this case, it would not. He needs perhaps a serious battery or other source of juice, but a capacitor wouldn't get it. Try not to attack personalities. If you claim to be here to be helpful, then be helpful. Otherwise, like other trolls, leave for more furtile grounds.

>
>Cheers.... Bob

I think the reason you are asking this question is because of the
undulating terrain. Under extreme undulating terrain the higher gain
(more focused) antenna might undulate to a point that the signal
pattern drops out from the repeater. The lower gain (more broadly
aimed) antenna will not drop out as easily.

Under steady state antenna conditions you only get 3db gain. That's
not much. If you are close to dropping out of the repeater with the
6db antenna then you are just about equally as close to dropping
out with the 9db antenna. Start undulating these antennas just
a little bit and the 9db antenna looses the small bit of gain it once
had. I would say if you are concerned with undulating terrain then
stick with the 6db antenna.

Ah think I get what you're sayin' Jay. Let me give it a whirl.

Pencilpusher. First off, when it comes to CB, "bigger is better" and "more is more" and the goal is to make folks howl with pain and say "Mercy Me, that is the (biggest,loudest, dirtiest, etc.) I ever seen".

So, you want the amp to draw a lot of current. That is a sign of macho-tility. Therefore your capacitors (think of them as the "cajones" of the amp) must be necessity be big, too.

And by all means get a bigger alternator, a heavy duty battery (or a separate battery) and puh-leeze fatten up the wiring. Thick wiring is akin to chest hair, so don't skimp here, or you could be seen as a limp-wristed wuss.

Now with this thicker wiring and revised alternator, you may need a bigger engine to drive all this. Fact, is, maybe you wanna get a bigger vehicle altogether. Like a Mack Truck or a Kenworth.

The FCC can easily figure out if your transmitting from a dwelling.
If you deny that you are transmitting, then the FCC can arrive at your
door with a search warrant and the sheriff. If it actually came down
to that, then you must have some kind of really weird reason that you
don't want the FCC to know you have a transmitter.

Scary, but I have to agree with Tnom. The rigidity of the antenna and how/where it is placed on the vehicle will determine its efficiency. I would suggest that you experiment with both at different times of the day to see if there is a substantial difference.

Its going to be even harder for the FCC to enforce its rules in this
day an age. They will have to be especially careful to bust an equal
amount from each of the races or they will be deemed racists.

Message-ID: <7oivla$k3c@dfw-ixnews14.ix.netcom.com>
Source record: 804

I have an old Midland 77-225A I want to install in my '98 Dodge Caravan with minimal hassle. I saw a thru-the-glass antenna at Radio Hack for ~$49, but have no experience with them. Do they (a) work reasonably well and if so (b) where is the best place to mount it. Alternatively, what is a good magnetic mount antenna?

Next question- I have a Midland accessory that ties the CB output into the vehicle speakers. Installation calls for routing the car radio output into the accessory box and then out to the speakers. The diagram shows 4 wires in from the car radio (+ and - from Left and Right channels) and 4 going out (+ and - to the Left and Right speakers). I have front and rear speakers, and pulling out the car radio I find a total of 6 wires going out to the speakers. Any suggestions?

Thanx for any assistance--

If you want reasonable perfomormance then no, they aren't good. If you want to get maybe 1 or 2 miles front and back on the highway then it will suffice.

Radio Shack does make a pretty decent 54" magmount whip antenna for $38.99. You probably won't even need to adjust it. However you can obviously get the best by going with a Wilson 1000, but this antenna is very tall. On top of your caravan it would probably hit things. The wilson Little Wil' will get you out reasonably, but careful placement on the vehicle and proper tuning of the antenna are required. You'll probably need to cut the whip by 1/4" increments until you get the SWR reading the be equal on channels 1 and 40. At this point your channel 20 SWR reading should be the lowest overall.

Howdy,

My name is Robert, and I'm new to the CB hobby. I've had a General Electric 40 channel CB for about a year now, a buddy gave it to me thinking I'd be able to use it. Finally got it hooked up in my 1986 Chevy Celebrity, using a magnetic maount antenna on the roof of the car made by Diesel. I also had to get a new microphone, the old one was shot, there was no modulation coming through. you could hear the CB click when you pressed the button, but no voice or sounds came through. Picked up a Northstar mic, and it's been working okay for me. Now, when the guy at the shop hooked my CB up to test the new mic, he said that it had previously been peaked and tuned, and that when he spoke into the mic, the CB was pushing around 20, 22 watts. I merely observed him testing it, I didn't see the meters or anything of that nature. got home and tested it on channel 2. I was picking up my neighbor up to about 1-1.5 miles from his house. And if this is supposedly pushing 20-22 watts with normal voice, I should have been able to pick him up from a farther distance than that. I don't know if it's the terrain, or what? Any comments? I'm more into this for a learning expirience. Oh, and my handle is Baron, and I normally run channels 2, 19, 22, but I do occasionally just surf the channels. So if you're in or near northeast Ohio, the Warren area, go ahead and give me a shout, the handle again is Baron.

Thank you in advance,

Robert

The FCC's right to "inspect stations" is very different from a search
of the "search warrant" type. The FCC has the right to inspect your
radio and radio gear, period. Nothing else. If there was a pound of
dope on your kitchen table as they walked by to get to your radio,
they could likely do nothing about it at the time because they were
there on the premise of inspecting your radio, not searching your
house for drugs.

The bottom line is, if you don't believe in or accept the FCC's rules
for operating a CB, then get rid of your CB's. That is what a Judge
would most likely tell you. As the rules are stated, the FCC DOES NOT
need a search warrant to inspect your station. You could cry foul
until the cows come home, but you wouldn't have a leg to stand on in
court.

These rules have been around since the beginning of radio. Now all
the sudden when the FCC decides to make examples out of a few illegal
operators, everyone is screaming about it. Contrary to perception, CB
is not a free-for-all radio service. There is always that possibility
that the FCC will knock on your door someday. If that happens and you
are running illegal equipment, you will most likely pay for it. Like
Beretta said, "don't do the crime if you can't do the time." But
faced with that situation myself, I think I would cooperate with them
and beg forgiveness rather than slam the door in their face. It would
most likely be much cheaper in the end.

The potential power output has nothing to do with its ability to hear a weak signal. The radio may or may not have a preamplifier which would boost the weak signal to the point that you might hear it more easily. Meters are not all made alike. The stock radio should do 4 watts on AM. In the unlikely possibility that it is producing 20 watts output, it probably won't do it for very long. Check to see how warm the radio is getting after you have keyed it constantly for a minute or two. It is also possible that if the technician was measuring in line with your antenna and not to a dummy load, and if this is the case, and if the antenna wasn't tuned properly, part of that 20 watts is likely reflected energy, so take it with a grain of salt until you determine the guy knew what he was doing.

905. Browning Mark IVA and a few Browning Parts forsale

Newsgroup: rec.radio.cb
Date: 1999-08-08 00:00:00 UTC
From: dcaudill@fuse.net
Message-ID: <37ad84e3.55361785@nntp.fuse.net>
Source record: 820

Browning Mark IVA..Works very good. All tubes 100%. Has extra channel mods, 2 different length pings, has been aligned on transmit & receive.
Radio appearance is about a 9 outta 10. Comes with stock Browning desk
mike. Also have a Mark II desk mike, but has a bad element i believe. Looks good and has the original stand, but doesnt work. Will throw it in too.
Now the bad news...Someone has put 2 mini switches next to the mic jack for the extra channels. Doesnt look bad, but I dont like drilling holes in a radio. Also, the cover for the transmitter has a dark spot on the top. Looks like someone set something on top of it that was hot.
Radio has a LOT of modulation and swing and the receive is very good. Very clean inside and out. I have a very good set of Mark III covers if someone would like them on the 4A instead, or if someone needs them,
will sell them seperate for 40.00. Also have a power transformer for a Mark III for 40.00.
Also have orignal Mark owners manual and sale literature.
If interested in any of the above, I'll take 400.00 + shipping for the 4A.
Please reply VIA e-mail.
Thanks,
Rick

I don't write a dissertation for every problem. But I like to help out.

> The question simply implied that when he keyed up, that the voltage would
> drop and stay there, and he was wondering if a large capacitor would help,
> which in this case, it would not.

This is wrong. And this is what I was trying to tell ya, without personally attacking you. Large storage Capacitors are used with the (High Power) Stereo Audio Amp crowd. These large Storage Capacitors will in fact improve the voltage regulation at the amplifier. Thats the job of a capacitor, is to take current to charge, and then it will try to maintain the voltage level, by either taking current to charge the capacitor, or give current to the load to maintain the voltage level. It will work, but how well, and will it justifies the cost of the large storage capacitors is another story. But people have reported to this news group that the large storage capacitors connected at the amp, do increase the output a small amount on SSB. I am sure if the capacitors where large enough, and one had a proper Peak reading wattmeter, some difference could been seen on AM. I would like to experiment with that.

Thanks for the polite response. What I am trying to say is that although these large capacitors may be able to smooth out these enormous changes in voltage when the guy keys, they are not going to hold the voltage for more than a second or two and that isn't going to help much in this situation, hence, the idea of using capacitors to maintain a high voltage simply isn't going to work for the guy, and yes, he should consider using a good battery, perhaps a second isolated battery, to maintain the voltage. Beyond that the price of the capacitors and the time needed to do the electronics would outstrip the cost/time it takes to install a battery. So my original question of whether he had confused the capacitors with a battery should stand. Yes I am stubborn, but I really don't think it is going to work for the guy. If he has a good alternator and a good battery, he should maintain adequate voltage. Beyond that, he likely has no need for an amp of that size but I suppose that starts another argument.

It is quite possible this radio's peak power is 20w (power out when speaking into it).

>got home and tested it on channel 2. I was picking up my neighbor up to
>about 1-1.5 miles from his house. And if this is supposedly pushing
>20-22 watts with normal voice, I should have been able to pick him up
>from a farther distance than that.

If you're meanig by this statement that your neighbor could only HEAR YOU 1.5 mis away, then I'd say you may want to look into a better antenna.
If you could only HEAR HIM that far away, then it could be his setup is not getting out very well, or again, you may want to look into a better antenna.
Radio Shack makes a decent little magnetic antenna that has what looks like a 3" diameter spring at the bottom, or Wilson makes the model 1000 magnetic mount. The Wilson is considerably more $, but is a better antenna.

Thanks for the input. I'm just going the basic route, as I'm doing it as low-buck as possible. Mark could still hear me from 1.5 miles away, I couldn't. Mark has a Cobra 25 model with a permanent-mount Firestick on the front of his 1993 Dodge Dakota. He routinely talks with people in Greenville, Pennsylvania, which is about 15 miles away from our houses. (we're next door neighbors). Wha price am I looking at for that Wilson 1000?

Thanks for the input.

Robert

I had the displeasure last of listening to amateurs on the Liberty Net last night (3.950). In addition, while these guys where trying to hold their weekly net, I heard other Hams playing music, white noise, farting sounds and a taped 60 year old radio skit from Amos and Andy in an attempt to block the broadcast.

Im certainly glad to see that not only CBers have this "supposed" propensity the perform illegalities. In a few short years if sure these guys will self-change the public's stereotype of Amateur radio operators because its the bad apples that usually set public perceptions.

Jeff, please tell me, how much time do you spend on the CB radio? If the answer is none, I cant imagine why someone who would not spend any time on the CB hobby, be so concerned about what is happening with that particular hobby.

Does your self ordainment also cover the FRS and GMRS hobbies as well, thus making you a "full spectrum" interloper? Judging by your email location, I would think that watching bikini claded women would make for much more interesting time fodder than worrying about what mischief CBers are into. Another suggestion to you might be to actually get involved in the correction of the degradation of your own hobby (Amateur Radio) before worrying about what the guys buying the $49 radios at Radio Shack are doing.

Someone else (a long time Ham) recently told me that opening the window in your shack at least once a month, thus letting some fresh air in, helps considerably as well.

But, you have actually given up that right by virtue of transmitting on the CB frequencies. You give up that right by way of Part 95.

Just like in most States when you get your Drivers License, you are agreeing to take a test to determine your blood alcohol level (BAL) if you are stopped/arrested for DUI. You have given up your right to require the Police to obtain a search warrant before obtaining the evidence, your BAL, which will be used against you in a Court of Law.

I'm not saying wether it is right or wrong, but it makes you think!

Gary- good answer and technically correct. There is lots of stuff preached and practiced on CB AND car audio that doesn't wash in the light of day. Capacitors for high power amps is one of them. A couple of Walmart $25 batteries will provide LOTS of amps at 12 volts, and if ya need more, just series/parallel them for 24 volts at a gajillion amps!!! If the current drain to charging duty cycle is very low, there is no need for much more than a 100 amp alternator. Just takes more time to charge the batteries up.

Subject: CB Help

I am wiring up a Cobra 10 Ultra AT On my Motorcycle and would like to mount a button up on the handle bars in a little box to key the mic and then use the mic in my headphones (from a small battery operated intercom) to talk on the cb. What I need is a wiring schematic that will allow me to activate the mic for the intercom when the button is out and then deactivate the intercom mic and activate and act like keying the mic for the cb when the button is out. Is there anyway you know of doing this and if so where can I find the switch that will do it. The cb takes a 5 button plug for the mic. and I have a spare mic that I can use to wire it all up with. If I have to use a small toggle switch in the box I can. Reason I want to be able to do this is for ease of operation and so I can keep both hands on the handle bars at all times.

Thank you very much for the help
Daniel Sherman

>signal can help in the communication. However, when the band is dead
>silent, there is no need to use one.

I have a browning golden eagle with a 80mfd ping. It's the oringinal noise maker, but most people say that it's very annoying. I did install a dpdt switch and a 20mfd cap.

928. Older radio info

Newsgroup: rec.radio.cb
Date: 1999-08-08 00:00:00 UTC
From: Power__House@webtv.net
Message-ID: <27142-37ADB651-43@newsd-132.iap.bryant.webtv.net>
Source record: 843

I picked up two older radios at a Garage Sale over the weekend, and was wondering if anyone could tell me anything about them, and perhaps a $-value of what they might be worth to a collector.

First is a Lafyette Telsat SSB-50 mobile. I would say it is a 9 out of 10. Missing mounting bracket, but the bracket knobs are still attached to radio. Unsure if they are the originals. They are rather large, and completely metal, not the plastic type that comes with modern radios. No manual or paper work.

Second is a Johnson Viking 352 mobile/base. I would say an 8 or 8.5 out of 10. No mounting bracket, or knobs. I don't know if the unit originaly came with it, but the radio is a mobile, and has a base stand where you can set the mobile unit onto. The base has a built in speaker and power supply you hook the mobile unit up to, effectively turning it into a base radio. No manual or paper work

Both units are 23-channel SSB radios. Any comments or information is welcome.

Wondering what is out there that compares to the Starduster I used to have.
I'd appreciate feedback on omnidirectional antennaes out there that
perform equivalent to or better than the Starduster.

Thanks,
Ken

The through the glass antennas are ok for CB only if you need to talk to people immediatly around you. You can usually get the SWR's to an acceptable level, but they won't work more than a couple miles at best.

As far as having your CB routed through your stereo speakers, here's an easier solution: Buy one of those CD adapters that look like a cassette that you plug into the headphone jack on the CD player and put the "cassette" in the casette player. Plug the end of it into your speaker jack on your CB, and it'll come out of your speakers, just like if you had it hooked up to your CD player. I do this all the time.

A new angle on an old troll. I predict the following responses:

1. Incoherent agreement. Lots of mispellings.

2. Brief spurt of ham hatred and ARRL bashing.

3. Hams respond with spirited arguments.

4. Peacemaker attempts to point out there is
good and bad in hams and CBers alike.

5. Profanity and personal threats made to me.

6. Further ARRL bashing. Examples of corrupt
hams given.

7. Hams point out poor CB practices.

8. Incoherent, confused post from WebTV user.

9. Call to both factions to come to their senses
and bury the hatchet.

10. FCC rules posted.

11. FCC rules disputed.

12. Government blamed.

13. Gun owners respond with 2nd amendment
arguement.

14. Keydowns blamed for CB problems.

15. Personal threats made to me. More profanity.

>house for drugs.

You could simply bring the equipment outside for the FCC to inspect. But if they say they would like to inspect your station, i.e. desk, chair, electrical outlets etc., and you refuse, they can't come in without a search warrant. If you let them in, and while going to your station they happen to see a bag of pot on the table, then your busted because it was in plain view and you voluntarily let them in the house.

I would suggest that if your the type who has illegal items in your house, then you should not transmit on any frequency, including a cordless phone.

>But, you have actually given up that right by virtue of transmitting on the CB
>frequencies. You give up that right by way of Part 95.

This is incorrect. You did not give up your civil rights that the
constitution gaurentees you. You have just agreed to have legal
action taken against you if need be, i.e. fines, search warrants,
surveillence, etc.

>Just like in most States when you get your Drivers License, you are agreeing to
>take a test to determine your blood alcohol level (BAL) if you are
>stopped/arrested for DUI. You have given up your right to require the Police

This is also incorrect. You can refuse to take a BAL any time your
pulled over. The consequence of this is that you will lose your
license for an extended period of time.

I don't know for sure, but here's my guess. If there was a pound of dope on your kitchen table as they walked by to get to your radio, and one of the agents recognized it, they would likely finish their business with you and then pass on a tip to a local law enforcement agency (In the course of their duties they observed the following, etc). Most judges would grant a warrant so that the local law enforcement agency could follow up.

I believe he is talking about a different device altogether. He's talking about the type of device that kills the stereo audio when the squelch is broken on the CB and the CB audio then takes over. I've used one of these and they are very nice to have when driving. Theres no need to fiddle with volume knobs. However, that was on a custom van which had it installed at the factory and I have never tried to install one myself.

Your problem is your antenna. Also, the conditions at the time you
tested will have an effect of the performance.

>house.

No, I think not. The FCC were there on the premise of inspecting your radio station only. If they were there to look for drugs, they would have to say so before you let them in, in other words you agreeing to let them look for drugs. If you were stopped by a cop for something, and he told you he was going to frisk you or "pat you down", the premise of this search is to look for weapons. If in the course of this "frisk", he found a joint, he couldn't do anything about it on the premise of this search because he wasn't looking for "a joint", he was looking for a weapon. If on the other hand, he told you to empty your pockets and you complied and removed a joint, your busted. The law is very specific on these things.

Yes, that is what would most likely happen. But short of the obvious
hypothetical situation above, granting the FCC access to inspect you
station is just that. The station only, nothing else.

Actually, what I ment and probably did not explain properly is that the SWR will be different along all points on the coax length. The reading will only be accurate at multiples of the 1/2 wave length point. At the 1/2 wave length point away from the the antenna feed point the SWR reading will be as accurate as your meter will allow. It will reflect the actually SWR at the antenna feed point. Hope that clears it up.

Right, my response was based on output and input impedeance being 50 ohms. If not, you will need to match with coax.

There are 13 states in the US that make it illegal to use a scanner in one way or another. It is perfectly legal to posses a scanner, in your house or in your car in the rest of the 37 states. A few of them make possession of a scanner straight up illegal unless you meet certian criteria, like you're a ham, a member of the press, etc. In NY, it is illegal to posses a scanner without a permit. Several states make it illegal to have a scanner only if it's in conjunction with a crime (such as breaking into a store at night, and you have scanner with you, listening for the police to be dispatched). Check out the web page in the previous post and check your state out.

It really isn't that stupid--it's the one you don't ask that is stupid!
Just off the top, it would depend upon the frequencies used by your
local police, but generally they are using the stuff above 800 MHz, and
local NOAA information generally is transmitted in the 160 MHz range. If
the radio is crystal controlled on these frequencies, it might be
possible to change them out, but I suspect it would be fairly expensive
for the parts and you would spend a lot of time to get there. Why not
get a general coverage scanner that covers the right range?

What a riot! My ham shack is a 10th-floor ocean-front condo, with a view of the Ala Wai Harbor, Ala Moana Beach, and Mamala Bay all the way out to Barber's Point. My "window" is a sliding glass door taking up an entire side of the condo, which remains open all day, all year (except during high winds / hurricanes). My sailboat is docked in the harbor in my "back yard."

If you're ever able affort a trip to Hawaii, email me -- I'll invite you up for a beer. The view from the "shack" is truly beautiful. (If you send me your postal address, I'll mail you a photo.)

As for watching bikini-clad girls on the beach, I'm have my own bikini-clad girl to watch! ;) She's an Asian beauty who's lot prettier and trimmer than the fat-chicks you export over to here from your side of the Pacific.

Now, what's your real beef with me posting CB'er NAL notices to rec.radio.cb? Attempting to anonymously ridicule the messenger just because the message scares you is pathetic and cowardly. I'll now make sure you're the first to know each and every time a CB'er is fined for illegal on-the-air behavior.

Jeff KH6O

P.S. I've already been to the beach this morning: I'm in the 80+ degree water every day at 6am for a 2 km swim. If you ever make it over here, I'll be happy to race you -- winner buys lunch. Be forewarned, though -- I broke three state swimming records a decade ago. I'll show you the medals if you have any doubts.

Correct. If the antenna impedance is not the same as the feedline, the SWR will
vary along the length of the coax. One can easily be fooled into thinking a good
SWR has been acheived when in reality if the SWR bridge is moved a fraction of a
wavlength in either direction the SWR will be different. Care as to where the
SWR bridge is placed is important. Ideally is is best to check SWR at the
antenna feed point.

First of all, peaking the output power won't make any difference in how much
further away you can hear people, it will affect how much further away people
can hear you. Second of all, using this radio is a violation of FCC
regulations and you are subject to fines and confiscation of your illegal
radio equipment, particularly if you are causing interference with other
devices, which you most probably are. Third of all, rather than run illegal
power, if you really want to get out, invest in a decent antenna. Those
truckstop specials generally are designed to provide a "close enough" match to
the transmitter, but generally don't provide any gain and waste more energy in
matching to the transmitter than they actually radiate out of the system.

I happen to be a licensed Advanced class Ham operator. I also happen
to be the owner of at least 4 CB radios. I became a CB operator back in the
summer of 1977 with the call sign KAXN-9546, which expired LONG ago. I even
still have my first CB, although it's not still in one piece and requires a
little work on the audio output section to be functioning again, a little
"Smokey" 23 channel unit. All my CB units are clean, legal, and
type-approved, just the way they should be, and have been that way ever since
I began operating. I have never, in the past 22 years seen the need for me to
run illegal equipment. When looking at radios to buy, if I see that they've
been modified I walk away. I am not interested in "soiled goods."
My ham equipment is the same way, unmodified, and operating according
to original manufacturers design specifications for output power, spurious
emmissions and the whole nine yards. That kind of operating is called
"courteous" folks. That concept is something that most of the CB operators
around here have yet to understand. Hell, I have a license to modify my ham
equipment. I also have neighbors who enjoy watching TV and talking on the
phone. Guess what. My urge to experiment takes a back seat to my neighbor's
right to view television programming or converse with friends and family.
Too bad there are so many "good buddies" who don't understand that
their "right" to break the law interferes on the real rights of others to
utilize the phone, the stereo, the television, etc. Then again, maybe they
just don't care.

>be different along all points on the coax length. The reading will only be >accurate at multiples of the 1/2 wave length point. > <snip>
>John

John: The SWR on a transmission line does not vary along the length of that line.
The value you will read on a typical meter MAY vary, depending on where in the line the meter is placed. Again, the SWR does not change, it is the same at ANY point on the line. A 1/4 wave section has the property of inverting the impedance at the other end, while a 1/2 wave section will repeat the impedance value seen at the other end.
The line loss will cause the SWR to show as less than the actual figure. SWR measurement is uncertain at best because of the small amount of reflected power when the mismatch is below 1.5:1. A reading less than 1.5:1 may be off by 25% or more, so don't take low numbers as exact!
One of the problems seen when measuring an antenna's SWR from the transmitter end is RF flowing on the outside of the coax. This will cause erronous readings, and must be corrected by a choke at the antenna end of the coax. Antron 99 antennas are especially bad in this regard.
The ARRL has some accurate, easy to read books on antennas. If you are into building stuff, there are nice construction projects that will fit right in with CB radio!!

he, he, he, ROTLLMAO. Jeff, its sounds an awful lot like you love to give yourself warm and fuzzy feelings, but believe me, the rest of the planet doesn't really give a rats ass. Perhaps you and that other symbol of amateur radiodom, The DonkeyBoy, should swap stories in order to see who has the best yarn. As far as NAL's are concerned, save yourself the effort because believe it or not, we CBers know how to access the FCC website just like you. You see, I just freed up some more swimming time for you.

Oh, and by the way, This posting was submitted from alt.radio.cb.

Actually, Gary, you and Mr. Lucas are correct but then not totally correct. First of all, on paper, CAPs usually provide for initial current draw and sustain for a period of time until it reaches its load capacity (voltage drop). Then the charging system feeds the CAPs and (depending on what farad capacity the CAP holds) the CAPs voltage steadies. Now, when hooked up to a keying-type amplifier, it does the same thing. Although the intial surge of amperage draw is "helluvalot" more than a commercial audio system, (if the vehicle is running) the mobiles charging system will kick in and sustain the CAP and battery's charge. Speaking through experience, CAPs is an excellent idea for surplus amperage/voltage storage. In all intents and purposes, it is a battery but doesn't hold any reserve amperage.

Why would hi-performance mobile stereo owners put CAPs in-line with their amplifiers and batteries if they knew it would drain and not hold any voltage/amperage to sufficiently run their stereo system? Usually, sound systems are played for hours on end. You rarely see any stereo system fanatic turning off their stereo just to charge up the CAPs and/or batteries.

Just my 2 Abes...

I bet you are probably right, although it will be tough to get many hams to admit to having 27 MHZ roots.

For some strange reason - and I am guilty of this too - many hams are ashamed to admit that they got their start in CB.

Although I got my Novice ticket in 1993 and quickly upgraded to Extra Class, I find that I used to have much more 'FUN' as a "free bander!"

From: David Proske <redneck@switchboard.net>
Message-ID: <37ADF5F2.1B1E@switchboard.net>
Source record: 1012

I am currently running a D104 Silver Eagle on SSB. To get quality audio, I just turn down the mic gain on my radio to 1/4 way. Would a sideband mic like the D104 with a 10-DAL head produce better sideband audio than what I have now? People say I have 10-8 audio on sideband with the mic gain turned down.

Exactly Jeff,
Up until about 1980 you had to be at least a General for a year to even test for Extra. I doubt that PUSSYCat is old enough to remember what happened in 1983 much less 1963.

I've known that PUSSYCat is a liar for months now. He makes antennas out of pine trees, he makes grounds out of magnets. Who does he think he is? MacGyver?

I'll bet your monitor has more than Wildcat cooties on it. Be careful! He'll threaten to call your employer, your ISP and even your mommy if you aren't nice to him! He's even less than a PUSSYCat.

Kevin, WB5RUE

In the 1960's they took prayer and the Ten Commandments out of our public schools hoping to liberate a generation. They succeeded. Now we have a generation who thinks they have the liberty to lie, cheat, steal, kill, freeband....

Those are both nice pieces. I have the Johnson, but I'm still looking for a nice SSB-50. If you want to sell it, let me know.
The power supply thingy for the Johnson is very cool, I have that too. It's got serious output too. That should be a bit of a collector combo there, the Johnson with the PS.

Dollar value? I'm no expert. I bought the Johnson PS for $20. I bought the Johnson 352 broke for $20.
I see SSB-50s going for about $40.

This seems in the ball park. Especially if you don't have any swing coming out of the radio itself. Could run alittle higher out of the radio but you might over modulate. The best thing to do is to get the most swing out of your radio and it should boost it up alittle. But don't expect too much more.
Tinker

Not necessarily... the presence or absence of an antenna does not mean a radio is being run there. I first got interested in having a base station when I moved into a house that had a beam antenna on top of a tower that was left behind when the previous owner passed away. The radio itself was taken by one of his kids and the antenna was simply left. Now, does the presence of an antenna give the fcc the right to demand entry into that house without a warrant?

To finish the story, one of the neighbors had an antenna concealed in his attic. He was running power and totally screwing up all of the TV's in the neighborhood. Someone called the FCC and because they could see the antenna (hanging in tatters I might add from years of neglect) they came to my parents door and demanded entry. At that time the only CB any of us owned was the barefooted Cobra in my Dads truck which was parked at his dispatch yard nearly 30 miles away.

This was back in the late 70's when the FCC's gestapo tatics were even more common than they are today.

Source record: 1027

I had a thru-the-glass antenna for a while. Don't know what type it was, but I picked it up at Radio Shack. Worked OK for receive, but the transmit range was pretty poor. I finally took the big step and drilled through the roof and put in a Wilson 5000 in and that was like the difference between night and day.

That is quite astounding since you had to take the Novice test by mail,
and the General at an FCC office, which was not open on week-ends, and
there was no Advanced class in 1963.

From: jdaggett@gate.net
Message-ID: <37b01e74.10600654@news.gate.net>
Source record: 1032

On Sat, 07 Aug 1999 17:29:02 GMT, pencilpusher@my-deja.com wrote:

*I noticed when my amplifier peaks at over 400 watts, the voltage drops
*to around 12 - 11.5 volts. Has anyone ever considered using one of
*those large capacitors used in car stereo sytems (ie."Street Wires" and
*"Phoenix Gold")? The capacitors are rated at a maximum of 20 volts.
*Does this mean they supply a constant 20 volts, or whatever your maximum
*output is on your vehicle's electrical system (ie. 14 volts). How large
*of capacitor would I need to sustain 14 volts at a 50 - 60 amp draw?
*The capacitors come in 1/2, 1, 1 1/2, & 2 farads.
*
*
*Sent via Deja.com http://www.deja.com/
*Share what you know. Learn what you don't.
****

At 14 volts and the a current drain of 60 amps, the load tothe battery appears as a .23 Ohm resistor. The size of the cap is not a consideration here. If you wanted a time constant sufficient enough, at that current drain, to filter peak IR drops from the power lines you will need to have a capacitance of at least 10 to 20 Farads. Since the load appears so small, any IR loss in the power cables to the amp will be magnified emensely. If you are not running at least #8 guage wire, no cap will help. To give you an example, If the resistance of the wire is ,25 Ohms, you will have only half the battery voltage across the amp. ANother problem also encountered is the internal resistance of the battery. In lead acid batteries that are fully charged this is about .1 Ohms. This rises to about .5 or more when nearly discharged.

Before you invest in buying a BFC, (Big Frigging Cap) I would increase the guage of the wire supplying the amp to as large as you can fit in the vehicle. Secondly I would wire the amp directly to the main distribution off the alternator. Thirdly I would verify that the alternator can handle the excess current. If after all these are met, then only would I consider a BFC. The BFC' sare only usefulll in handling peak current loads. They help to smooth out the peak ripples that occur on peak demands. The BFC is not a voltage source. It only stores a small amount of energy as compared to a battery. It is used expecially in audio systems to supply enough energy during the peaks of the audio signal in large systems. The same can also be applied to radio. On very large peak demands will the cap supply energy to replace that which is lost in the resistance of the wires feeding the amp. Once the energy is used up in the cap, it needs to be recharged. The only way it can be recharged is to reduce the peak current drains.

As for the value and voltage rating of the BFC. For a mobile application and large peak current applications, larger is better. The problem is that larger is

more exspensive. For the voltage rating of the BFC, 20 VDC is a minimum. If your regulater fails the voltage out of the alternator can reach 18 to 24 VDC. I would hate to see a cap of 2 farads explode. Also with caps that big make sure the terminals are not exposed. A short across those will really cause a spark. Arch welding type sparks. To give you an example, I left pits on a srewdriver from a .1 Farad cap charged to 12 VDC when I discharged it. A 2 Farad cap will diffinetly arch big time.

James

Receive would be no problem. Your CB antenna is much longer than necessary but
that just means you are at multiples of the wave length of the 154.8MHz frequency.

Hey Gang!!!
Finally went through entire box of tubes purchased at an estate sale WHEW!!!!
Gonna compile a list for email for those interested. some in boxes some wrapped
in tissue. opened all to insure that what the box or paper say's jives.
Tubes will be priced from $2.00 to to $45.00.
Here are a few on the list! will have list ready for email Monday am. 73

(9) 807 $9ea
(1) 6146 $12
(2) 6JB6 $22 ea
(1) 6KD6 $45
(1) 42 $17
(1) D32 $19
(1) 76 $12
(2) 6HF5 $14ea
(1) 6F5G $12
(3) 12BY7A $8ea
(2) 12AT7 $6ea
(4) 12BEG $4ea
(3) 5V4GA $11ea
(2) 6V6GT $9ea
(1)5881 $24

Oh, now I see that I've been exchanging posts with a pathological liar.
Even as late as 1976, when I got licensed, one had to go to an FCC office
to upgrade from Novice to General. Monday through Friday, only -- govern-
ment offices were closed on Saturdays. There was no VE testing system as
we have today (and one had to wait about three months for the license
to arrive by mail). In 1963, I believe one had to have been licensed for
at least one year prior to being allowed to take the Extra Class exam.

Yuck, my monitor has "wildcat" cooties on it -- better disinfect it.

You can do whatever you want, but you might want to check on the
www.fcc.gov page under enforcement.

The FCC says they do NOT NEED a warrant to inspect equipment during
hte hours it is being operated.

The MAXIUM FINE is usually assessed against those who refuse entry to
the FCC people. Most of the time they assess $7,000.00.

Make your own decision, but I'm going to let them in if they come to
my door!

There are different grades of stainless steel, and some manufacturers
have better production and quality control standards than others.
Although I haven't compared all the SS whips side by side I wouldn't
dismiss the possibility that some are better made than others. I do
know that Radio Shack's product standards are not always top of the
line, they try to keep prices down by going middle of the road.

IF the charging system (or power supply) could react quickly enough to recharge that LARGE capacitor, then there would be no need for the capacitor!!! Sure the cap will aid in supplying current on peaks, IF the peaks are far enough apart that the cap can regain it's charge. Run some numbers with current draw, voltages, cap sizes, and time constants to see how little help the caps really are.
Second point is that most mobile stereo owners are NOT very high performance!!!
They are usually brain-dead from the intense pain cause by the excessive sound levels in their vehicles. So they often buy stuff for their system(s) based on some other clod's advice. Anyway, a bank of pretty caps, wired neatly, mounted in a nice pattern, does look great, and has made some money for the seller. The buyer also has had to work at his job long enough to buy the caps, so I guess everyone's ahead.....my money goes for better antennas and such.

This is very interesting because the State of Massachusetts is currently debating a similar law. The MA law would limit cellphone use to "hands free" operation which would mean that a cradle for the handheld cellphone would have to be installed in the vehicle. When I heard the details of this proposed legislation the first thing that came to my mind is "How does one call another without any type of VOX system?"

One would still need at least one finger on a number memory button to activate the cellphone.

You're absolutely right Jeff, someday with a quality education I'll actually be able to hang up my McDonalds hat forever. That French Fry oil was really getting to my brain. Thanks for the tip.

> I'm really flattered that you think it's a yarn, but it's all easy to

You might want to put that quality education of yours to work and find out the real definition of a yarn. I suggest you use Funk and Wagnalls as compared to Websters Unabridged.

> But now that I know it bothers you, I'll be sure to post the NALs.

Ha! Its not the NAL's that bother me, mostly because the NAL's are being handed out to more amateurs than CBer's. Its the fact that some pompus, self righteous, and sadly confused individuals think that because they passed a test that a 12 years old girl just passed, they are self ordained radio cops. It is actually pretty pathetic. In addition, SOME of these same guys feel the task is theirs, to enlighten the uneducated (or under-educated) radio enthusiast because THEY supposedly know more. You seem to be the quintessential poster boy for this group.

Why use a cap if it does not hold any reserve amperage?

The reason the caps help the audio guys more than the CBers is because of the peak loads during heavy bass output. You know those that shake windows and such. The cap stores excess energy for these kicks, and usually have time to recharge before the next quake. I have buddies who enjoy the car audio hobby and the caps do work.

>Those are both nice pieces. I have the
>Johnson, but I'm still looking for a nice
>SSB-50. If you want to sell it, let me know.

Thanks for the response. I'll be holding onto the radios for a while. Haven't had the opportunity to test the SSB-50 for functionality yet. I'm sure it works though, the guy said they both worked, and I do know the Johnson does.

>Dollar value? I'm no expert. I bought the
>Johnson PS for $20. I bought the Johnson 352
>broke for $20.
>I see SSB-50s going for about $40.

Well, I guess I got a good deal then. Paid $10 for the SSB-50, and $12 for both the Johnson and the supply. Considering the condition they are in, I'm happy I picked them up.

A question: Is there supposed to be a plastic window over the channel display on the Johnson? It looks to me like there should have been, as there isn't one on the unit I picked up. Doesn't seem natural to leave the display "open" like that.

Thanks again,
Power House

David, have you tried the opposite, set the radio mic gain at 75% and adjust the D104 down until you get strong but clean audio on SSB.

Sorry , I have never used any of the voice compression or SSB mics. I have operated on SSB for about 10 years and the method above worked well on my Grant.

Some basic SSB info:

The person that took this test was my brother and the testing was given at The Customs House in Boston, MA (which is where the FCC office was/is? located). I never said it was I who took the test because I sat for the General Exam in 1975 at the same location, and I hate to break your heart, but it was on a Saturday. As far as the Advanced Class is concerned, I am not an active amateur, nor was I ever really one, so I do not know the structure and the dates of the amateur licensing system. I was under the impression that he was an Advanced class ticket holder however he did take all of the appropriate tests in one (1) day.

I do not think that the cap will be much help on a CB amp, but the SSB operation application is interesting. I wonder how large the cap would have to be in order to be effective. I bet you could get an alternator upgrade and a bettery for the same cost.

I have never used a cap for a mobile CB amp, and I suspect that it is not worth the effort.

In my opinion large RF amps are not necessary. RF energy is serious business. I don't want to be beside someone transmitting 1000 Watts of RF power anymore than I want to be beside someone who took out the spare tire and replaced it with three 12" subs.

Pathological Liar, yup thats me Jeff, whatever still gives you that warm and fuzzy "superiority" feeling. It probably comes from that lack of a quality education. This is usually what happens when I comment on things that I am not "completely" familiar with, similar to the Hams who spend a considerable amount of time on the CB newsgroups touting rules/regulations and Constitutional Law that they aren't completely familiar with. An arrogant smart-ass perhaps, but a liar I'm not, Im called too many other things and I cant take on any new titles.

Sounds like you're a tad bitter about my previous post.................a good swim will work it off.

Well I hate to break your heart, but you could ONLY take the Novice test
by mail, even in 1975. I quote directly from a 1975 ARRL License Manual,
"The Novice Class license examination may now be taken only by mail."
They did not give Novice tests at the FCC office, so he must have
already held a Novice license. So I suspect he only upgraded to General,
and he would have had to held a General Class license for two years
before being eligable to upgrade to Extra. So he could not have gone
from General to Extra in two weeks.

Perhaps you are correct JJ and dont worry, my heart isn't breaking.
Unfortunately my brother is no longer accessible to verify the information I
posted however I differ with you about the Novice Exam. I personally took
the Novice Exam in 1974ish and this was done in person. This fact I am
willing to bet the farm on. The person who posted that the license took 3
months to get back from the FCC is probably correct as well because I
remember that it did take some time to get the ticket back, however I
thought it was closer to about 6-7 weeks.

What you need is a 50 Ohm, non-inductive power resistor. In this case, 20W would be the best. They can be tricky to find, but do exist.

If this unit is a 4Watt mobile, you can cheat by using a #47 light bulb soldered to a PL259 connector. This way you can determine by the brightness of the light just how much output you have.

Cheers!
Andy

IF the charging system (or power supply) could react quickly enough to recharge that LARGE capacitor, then there would be no need for the capacitor!!! Sure the cap will aid in supplying current on peaks, IF the peaks are far enough apart that the cap can regain it's charge. Run some numbers with current draw, voltages, cap sizes, and time constants to see how little help the caps really are.
<<<<<<<<<<<<<<<<<<<<<<>>>>>>>>>>>>>>>
the biggest thing that the caps will do will be to ease the jolts on the diodes and the stator in the alternator by more evenly pulling on it as well as more evenly distribute the juice to the system. In other words the caps will maximize the flow while evening it out. Less hard hits and more smooth ones. If you're trying to get more than the alternator will provide you will be replacing it soon, so just buy another or so now and mount it in advance.

1072. short circuit

Newsgroup: rec.radio.cb

I bought a brand new Cobra 18WXST cb and it blows fuses immediatly after plugging in the cigarette lighter plug. I checked the polarity in the wires for the plug and they are correct.

I then disconnected the plug and just took the 2 wires on the CB and connected them straight to the battery, the positive cb wire has an inline fuse which blows up immediately.

I don't even have the cb powered on in any of the situations above.

Is this cb junk? Is there something else I'm missing? Wiring a cb with 2 wires into a cigarrette plug adapter seems pretty straight-forward.

I'm beginning to think my 'new' cb is someone else's returned cb. If someone had hooked it up incorrectly, wouldn't the fuses protect the cb? How can it be checked?

thanks for your suggestions,
mark

The licensing process has only become quick in the last couple years, since the FCC went to a more automated system of issuing licenses. The last license transaction I had under the old system was in 1993, and at the time it took over 2 months to get the license back in the mail. Now the license is assumed issued when it appears in the data base, so if you take a test tonight, the vec gets the information tomorrow or the next day, checks it and then sends it on the the FCC, and within a day or two, the license is issued. Quick.

Wildcat wrote:

I AGREE WITH ANYONE WHO DOESN'T LIKE THE FCC COMMING INTO YOUR HOUSE TO INSPECT YOUR STATION WITHOUT A SEARCH WARRANT BUT THE SAD TRUTH IS THAT BY OPERATING A CB RADIO, YOU ARE AUTOMATICALLY LICENCED TO DO SO.
THE TERMS OF THAT LICENCE SAYS THEY CAN DO IT!!!
THE CONGRESS OF THE U.S.A. IS A LAW MAKING BODY SUBJECT TO THE VOTERS OF THE UNITED STATES.
THE FCC IS A RULE MAKING BODY SUBJECT TO NO ONE BUT CONGRESS.
THE FCC CAN CHANGE THE RULES IN THE MIDDLE OF THE GAME MOSTLY WITHOUT CONSULTING ANYONE.
ELECTED GOVT. OFFICALS MAKE LAWS THAT, IF BROKEN, CARRY PENALTYS.
THE FCC MAKE <RULES> THAT, IF BROKEN, CARRY FORFITURES.
I'VE NOT SEEN ANY OTHER COMMITTE OR COMMISION ANYWHERE IN GOVERNMENT THAT CAN MAKE RULES,AND A RULE THAT THEY CAN COME INTO YOUR HOUSE AND INSPECT/ CONFISCATE YOUR PROPERTY,ISSUE YOU A NOTICE OF APPARENT LIABILITY IF YOU DO NOT SUBMIT ALL WITHOUT A WARRANT.THEN ASSUME THAT YOU ARE GUILTY AND MAKE YOU PROVE YOUR INNOCENCE EXCEPT MAYBE THE I.R.S.
THEY ARY VERY CAREFULL NOT TO CALL RULES, LAWS AND FORFITURES, FINES.
AND ALL THIS IS ON EVIDENCE PROVIDED USUALLY BY DIGRUNTLED HAMS WHO PROTECT THEIR W I D E SWATH OF SPECTRUM LIKE THEY OWNED IT AND WERE LICENCED TO USE IT BY THE A R R L.
I AGREE THERE IS NEED FOR SOME SORT OF CONTROL BUT THE RULES ARE ANTIQUATED IN LIGHT OF ADVANCES IN TECHNOLOGY LIKE BETTER RECIEVER ADJ. CHANNEL REJECTION AND THE 125 MILE GROUND WAVE RULE NEEDS TO GO. AND DON'T EVEN GET ME STARTED ON THAT BAD JOKE OF A CODE OR WE'LL BE HERE ALL DAY.
JUST SOME THOUGHTS.

JEFF

You lost me.

Why does applying a voltage to the tin can create magnetism on the piece of steel inside?

What do you mean by "electromagnetic degradation"?

Why would a coax in a car experience any "electromagnetic degradation"? Would not any effects from a magnetic field on a coax be cancelled out due to the fact that the coax contains two conductors which carry currents in opposite directions? Isn't the differential voltage (or current) the same regardless of the effects of a magnetic field?

The whip itself might be the same material--maybe even from the same subcontractor, but the base is really what you are paying for, and how it attaches to the actual whip. Take a look at the construction of the base.

Message-ID: <37AF00FD.CC808189@arn.net>
Source record: 1079

I have a SSB uniden chassis similar to the Cobra 142GTL.
I put a 4.7uh choke in series with the varactor diode to give
me more slide. Well it did. The problem is I can't align the
pll with the clarifier in center position. To be on frequency the
clarifier is almost full clockwise. It will slide a full 10KHz but
I want the clarifier to be centered when on channel. It seems
ct3 does not have enough range but I added and subtracted
capacitance, and still nothing works. I even added the same amount
of inductance to ct3 and that did not help. Am I missing something
here? Surely this can be done. The alignment step is the
34.9875MHz adjustment on channel 19 in USB. CT3 will not
go above 34.9842 with the clarifier centered. Anybody done
this before?
Larry

You are right about the loose joint at the chipswitch. I thought I had a bad display until I came up 81N through PA and the bumpy roads knocked the chip most of the way out. Upon inspection I realized that it had come out of the socket. I put it back in and all is well except that now I have to push the band button at least once before the radio will rx/tx. All I did was push the chip back down and seat it well in the socket. I had to bend a couple of the legs a little to get good contact. Also you may want to consider having the socket removed and having the chip soldered directly into the board. It may solve your problem permanently.

By the way this was the first time the radio was mobile, as I was using it for a base for 2 years. I bought it new in the box and had the chipswitch installed by "half-breed" in the Binghamton, NY CB shop. This was a great talking radio until this incident. I have never had to take the covers off of it until this and when I did I discovered burned wires, plastic components, and poor soldering. I think a blind monkey with no fingers could have done a better job. Please be careful, as I thought I had a decent setup until I really looked closely and avoid that shop like the plague.

Robert,

I think the suggested retail price of the CBS-2100 will be around $495.00. If I were going to put a price on the CBS-2100 at this time I believe it would be around $260.00. And of course we will meet and beat any competitive pricing.

Thanks for your interest in Palco Electronics,

Tony

Hi Robert,

Really nothing to it. Order the Wilson W-1000 Magmount. When you order specify that you want the Wilson SLA antenna in place of the 62" whip that normally comes with it. The cost of the SLA antenna over the 62" stinger is $3.00 more. Put your Antenna on the roof, run and route the coax already attached to your mag base to your radio, install your antenna (62" or SLA), set your SWR and you are in business. If you decide you want the 62" whip as well as the SLA antenna, the price of the SLA antenna will be $11.99. And of course as usual we will meet or beat the competition.

Thanks for thinking Palco Electronics,

Tony

Guess thats the reason when you walk through an auto parts store, you
see that all the battries are all stuck together. All that voltage on
the posts creating all that magnetism. Make almost as much sense as
we have lightning strikes because of magnetism attraction.

I recieved this via email 1 week ago with instructions to post this so
it cannot be traced.
I had forgot to post this then so here it is, am an now doing this while
on vacation.
Stan VE3PET

RADIO HAMS SEE THE TRUTH
It is finally hereï¿½. After months spent enduring the garbage which has
been spewed forth by the members of the JOKER AMATEUR RADIO CLUB, THE
NOMOJO AMATEUR RADIO CLUB, and the even more disgusting GROUP OF CERTAIN
NAZI HAMS THAT FREQUENT THE 146.94 AND 147.045 REPEATERS, AND THE 147.57
SIMPLEX FREQUENCY and their band of mealy mouthed, back stabbing, two
faced lying malcontent faggots, decent law abiding amateur radio
operators in Palm Beach County have begun to take back their clubs and
airwaves.
Fed up with the lies and innuendo, which have caused considerable
division amongst local ham radio operators and Palm Beach County
Government. A cohesive effort to thwart the efforts of this virulent
minority has come forward to stem the tide, which is poisoning our hobby
and causing the PALM BEACH COUNTY government to realize that some of
their employees are thieves, druggies and liars

Recent elections in the West Pal Beach Amateur Radio Club sent a clear
message to these STORM TROOPERS of ï¿½THE FUHRERï¿½ W4SS, MANNY PAPANDREAS
that their brand of amateur radio guerilla politics and HITLER TYPE
PRACTICES are welcome in Palm Beach.

The actions of ï¿½THE FUHRERï¿½ W4SS MANNY PAPANDREAS, AND STORM TROOPERS
KG4U GRAF T. FUCKENMAIER WD4IUD, WALTER PEACE, AD4PS, DENNIS HAMILTON,
W2TIA LEO WINTER, W1OB, JAMES DOVER AND K4LES LESLIE FAGGOT CARTE have
caused the cessation of all traffic nets in the West Palm Beach Area.
Some of these individuals have done serious damage to the long running
West Palm Beach Test sessions.

Even Federal governmental agencies are wondering ï¿½WHAT GOING ON IN PALM
BEACH COUNTYï¿½. They look at Frank Haggerman and have him on their list.
FRANK FOR SOME REASON CANNOT FIGURE WHY THE SECRET SERVICE visited his
HORSEBARN THAT HE CALLS HOME AND QUESTIONED HIM ï¿½WHY DID HE MAKE THREATS
AGAINST PRESIDENT CLINTONï¿½. But we all know Frank is a good radio hamï¿½HE
NOT ONLY MAKE TREATS AGAINST THE PRESIDENT BUT HAS BEEN CAUGHT JAMMMING
ON VARIOUS REPEATERS NUMEROUS TIMES. BY THE WAY FRANK HAS THE INTERNAL
REVENUE SERVICE SETTLED UP WITH YOU YET?

Keep up the good work Frank, THE FUHRER MANNY W4SS WILL BE PROUD OF
YOUR NAZI/HITLER TYPE ACTIONS.

After the ARRL disbanded the test team for violations of FCC Part 97 rules this test team has been able to regroup and continue to operate under new management and a liaison that is honest and will not allow the unethical games played by the previous NAZI test team to continue. KG4U GRAF T. FUCKENMAIER AND AD4PS ARE NO LONGER allowed in the ARRL VE program. AD4PS DENNIS HAMILTON WAS KICKED OUT OF THE ARRL VE program because of questionable actions during an ARRL test session. Membership is all of the major clubs and repeater groups in the area have suffered tremendously along with repeater traffic dropping to an all time low. Several hams that are currently under the employ of Palm Beach County Government and local municipalities have been the targets of investigations as a result of their actions such as thievery, ethnic slurs, threats against civilians and homosexual actions on county time.

PALM BEACH COUNTY government officials have issued a direct order to AD4PS DENNIS HAMILTON, not to use any amateur radio equipment while he is on County time as a result of threats made by him to a County civilian. Believe it or not AD4PS DENNIS HAMILTON is the R.A.C.E.S. officer for PALM BEACH COUNTY. WHAT A DISGRACE TO THE R.A.C.E.S. PROGRAM AND TO PALM BEACH COUNTY. KEEP IN MIND THAT ï¿½THE FUHRERï¿½ W4SS MANNY PAPANDREAS IS THE HEAD OF THE PALM BEACH COUNTY EMERGENCY MANAGEMENT PROGRAM. This program is now suffering from lack of participation due to the action of the NAZI managers of this much-needed emergency program. Even the faggot infested Wellington E.O.C. has better participation in emergency programs.
As a result of these actions there has been a resurgence of decent amateur radio operators who have vowed to take up the fight against this insidious cancer which has plagued the hobby here in West Palm Beach. There is currently a loose confederation of hams who have begun to rally around this silent majority and move toward regaining control of ham radio, and sending forth the message that ï¿½THE FUHRERï¿½ W4SS MANNY PAPANDREAS and his lying band of disgruntled malcontents NAZI STORMTROOPERS donï¿½t speak for the rest of us.

I get the feeling I did not properly state my circumstances and equipment setup in the original post. Although the postings thus far have been very helpful. I am running a 100 amp alternator, one auxillery group 24 battery, and 4 awg wire that is reduced to 6 awg at the amps connector (approx 24" prior to the fuse assembly). The voltage drops to approx 11 - 11.5 volts only at the peaks of modulation, but returns to approx 13+ volts throughout the rest of the transmission. If there is any interest left in this topic, do you think that a capacitor would now serve my purpose to sustain voltage. If not, it sounds like a 150 amp alternator is the way to go. Thanks for the help.

yes the 2510 can actually be made to unlock and go very low. these are the only ten meter only radio that are of good enough qaulity to be full ham radios. take a look at www.chipswitch.com and it has the info about the wide banding. 73 tim 2-IR-082

I don't want to open the amplifier can of worms here, but you might want to ask yourself just how much power do you need and at what cost. How much farther do you expect to get if you pump another volt into the amplifier? The last time I had to buy an alternator it certainly wasn't cheap. For you this might be a hobby. Heck you might want to get those air shock things on the car as well and make it bounce up and down as you go down the street--I don't know--but dollar wise, it seems non productive. Still don't think a box full of capacitors is going to do much for you, but hell, spend the money and keep someone in a job. Sounds like that is what you want to do anyway.

Increase the size of your alternator since when you keyup and modulate the battery voltage drops below that of the batteries normal 12 volts meaning your alternator and battery are not keepeing up with the demand adding a capacitor will do no good. You could also use a 6 volt and a 8 volt battery in series to give you 14 volts you will need to charge them at 15.8-16 volts, which will give you more watts. Don't worry the rest of the cars electrical system will handle 16 volts easily. What size amp are you using, you may want to turn the deadkey down this way you only draw minimum amps under a deadkey.

I have this Yaesu tuner for sale, 500 watt capability, two meters for Power and SWR, the tuner is in good shape. Some scratches on trim top cover in right corner has a ding, and one of the knobs have a crack(easily replaced). Inside of tuner is spotless.

If interested I would sell for $160.00 or trade for small base amplifier(300 watts) in perfect working condition.

Thanks for reading
Kevin

Doesn't that particular CB have three wires? Black, Orange, and Red?
Anyway. As Gary wrote, just take it back if its new. If it isn't new, then it almost sounds like the reverse polarity diode is, hmpt, reversed.
Chances are if your cigarette lighter is NOT a center positive, and if this is the route you chose first, then it blew the fuse AND the reverse polarity diode. Either way, STOP TRYING! This would mean that you would need to replace this diode, and use a continuity tester to check continuity between the positive wire on the cigarette lighter plug and its center conductor on the plug itself. If there is continuity, then the wiring of the plug itself is correct. Now, use a multi-meter (volt) to check whether or not the center conductor on the cigarette lighter (where you put the plug) has a positive charge.
Its pretty much standard now with the ever growing use of cigarette lighter plugs to make the center conductor positive, but, better safe than sorry.

Or, if everything is correct, then the CB is junk. But, check all of this before junking another one, to save you time and effort.

Hank

The battery has far more "capacity" than what you can add with a few
capacitors. Adding another battery in parallel would do more than
capacitors.

Hey Wildcat
I got my start in CB radio too. Like you I seem to have more fun as a freebander. I got my Novice ticket in 1976. I'm a advanced operator. I saw little Richard on a movie on HBO. As he ran off at the mouth he sounded like one of the clowns on channel six. All I could do is laugh. Don't get me wrong I have had alot of enjoyment out of my ham license.
Sparatic E-skip on 11-meters is still fun to listen to. That north to south skip is always fun to listen to. That crap that comes out of rico sucks.

what relevance does that have to do with anything? ham liscence doesnt matter. you have to be a well qaulified technician capable of making refinements to the radio while using the chip to unlock it to go that low. most general hams arent smart enough for that.

> Then why isn't it called HAM type activity???

You're missing the distinction between CBers who happen to be
licensed but continue to behave like CBers, and hams who behave like hams.
"Ham-type activity" falls into a ninety-plus-year-old well-defined
category (see below for our modern-day government-mandated charter).
Operating outside that category places one outside "ham-type activity."
For example, the CBer who gets his Advanced ticket but says he misses his
illegal free-banding days is certainly on the peripheral edge, walking
that fine line that separates him from the established amateur category.

Hope that helps.

Jeff KH6O

97.1 Basis and purpose (of the Amateur Radio Service).
The rules and regulations in this Part are designed to provide an amateur
radio service having a fundamental purpose as expressed in the following
principles:
(a) Recognition and enhancement of the value of the amateur service to the
public as a voluntary noncommercial communication service, particularly with
respect to providing emergency communications.
(b) Continuation and extension of the amateur's proven ability to contribute
to the advancement of the radio art.
(c) Encouragement and improvement of the amateur service through rules which
provide for advancing skills in both the communications and technical phases
of the art.
(d) Expansion of the existing reservoir within the amateur radio service of
trained operators, technicians, and electronics experts.
(e) Continuation and extension of the amateur's unique ability to enhance
international goodwill.

*
* IF the charging system (or power supply) could react quickly enough to
*recharge that LARGE capacitor, then there would be no need for the
*capacitor!!! Sure the cap will aid in supplying current on peaks, IF the
*peaks are far enough apart that the cap can regain it's charge. Run some
*numbers with current draw, voltages, cap sizes, and time constants to see
*how little help the caps really are.
*<<<<<<<<<<<<<<<<<<<<<<<<>>>>>>>>>>>>>>>>>>>>>>>>
* the biggest thing that the caps will do will be to ease the jolts on the
*diodes and the stator in the alternator by more evenly pulling on it as well as
*more evenly distribute the juice to the system. In other words the caps will
*maximize the flow while evening it out. Less hard hits and more smooth ones.
*If you're trying to get more than the alternator will provide you will be
*replacing it soon, so just buy another or so now and mount it in advance.
****

Not if they (caps) are discharged sufficiently enough. A fully discharged cap
will appear as a dead short on those diodes.

Yep just take the step response of a RC network and it is real easy to see if a
cap is effective. Now to take the step response one needs to know the initial
voltage, the series resistance of the wire, the source resistance and the load
resistiance as well as the cap value.

real simple.

Jeepers Joe I only made #2. I thought for sure Id be numero uno. Im somewhat disappointed. Tell me, what the hell happened during this post that drove you off of the deep end because I cant seem to find anything THAT bad.

With regards to "Another Stellar Day on the Amateur Airwaves", do you feel that this behavior is appropriate of Ham radio operators or do you feel that because it was I who posted this, that this is Ham hatred? Did you actually read some of the responses? Especially the comment made by the Ham who questioned why someone analogized that type of behavior with CBers? Sometimes the truth hurts.

So, what "other things" need to be done when running power??

Also, I keep hearing that you really need to make sure the antenna is
grounded properly. How is this done with a mag mount? I guess the
grounding point would be where the coax connector hits the back of the
radio. In this case, would the coax shielding provide the ground from
antenna to auto frame?

Dale.

Actually, I prefer public knowledge, no offense. The 76 does not have a direct modification for its PLL IC. Though a collpits oscillator (Expo Kit) will allow for "extra" channels.

I believe now that I think about it, is the A or S kit. Dont know, I just recently looked for another gentleman, but dont have access to non of my service manuals and/or catalogs at the moment. Try Left Coast of Bills-2-Way, and I believe Thomas Distributing carries them. I make my own, so, not sure which one, sorry.

I haven't looked at the schematics yet, but I believe it is D67. You can achieve this by cutting one leg as TRAMD300 mentioned, or just totally remove it, which if the tech does this (which I dont care to participate in) he/she will now have a known working component...get me? Also look on the underside (tracing side) right from a pin on the audio chip might (should) be a .01 micro-farad disk capacitor soldered in series with a resistor (value can vary depending on how much talk back the tech decided to put in it) going to another trace (sorry I would have to be looking at one to know where exactly), this will be the only capacitor-resister series from the audio chip, which is against the side of the radio (10 pin integrated circuit if I remember correctly). Hopefully this help. Oh, yeah, my point is you would want to remove this also.

I will look at my service manual as soon as I get a chance and tell you exactly what type of diode gets cut/removed. Im sure just a general purpose signal diode should work in place of the one removed, but let me make sure.

Hank

I wouldn't pay more than $65.00 for one, and that in itself is high for where I live. Try to find a used one if you are going for low buck. Also, what model GE radio is it? Model numbers along with brands always helps us all out to better help you. You could have a radio capable of extra frequencies right from the PLL (Phase Locked Loop) IC (Integrated Circuit). In a nutshell, it, umm, trying to keep it simple......controls the frequency your radio is operating on (please other non-newbies, not hate replies, but its the best simple explanation I could give)...

if you add another 12 volt batt it will require 15 to 30 more amps to keep this batt charged while in use. if you have a 100 amp alternator, then you should be able to run about 60 amps of peak current draw without any problems, meaning you should be able to run a five pill,or some where around 375 rms watts, the only thing adding a shitload of batteries will do is keep your voltage from dropping below "their" voltage, if you to keep your voltage around 13.8 you'll be better off not running a bunch of batteries and let the alternator do its job without trying to replenish a bunch of batteries. On the capacitors, they will keep your headlights from dimming when you modulate and will take some of the inrush load off of your alternator, but you will probably need about 2 farad to keep up with50 or so amps peak current, but you money will be better spent on an alternator or larger wire or something of this nature. when fusing keep the fuse as close to the battery as possible, and size it to fit the current rating on the wire. make sure you have large enough wire coming from the alternator. the factory wire is not enough, and there is a good chance that this may be where your problem may be. the ground must be as big a wire as the hot. depending on the make of the mobile you might need to upgrade the wire bonding the engine block to the chassis, keep in mind that engine is on rubber mounts. just my 2 cents, hope it helps.

GOOD LUCK!
Peak-A-Boo in the star!!!

Your test set-up is poor. If you were really keying at 100
and peaking at 140 you'd sound so muffled that very few people
could tell what you were saying. The real dead-key wattage
out of those amps is in the 50 to 75 range, and the peak wattage
is in the 120 to 200 watt range.

If you don't know the difference between dead-key, average, and
peak wattage, you should read the AM Tutorial on my web site--
it'll clue you in to what the deal is. There's a link to it
below.

I've heard the ham bands in the US are already suffering from interference by many Part 15 wirelessgadgets. This is primarily on the worldwide bands. Need to clean this interference up, or
there will
be a lot of static on HF for Amateur radio operators to endure.

Source record: 1160

The 455 is rated at 60 peak watts with 2 peak watts in at 12.5 volts.(1) That would mean 2 of them would hit 120 peak watts with 4 peak watts in at 12.5 volts under load.

All CB radios deliver more than 4 peak watts into their loads. Almost all linear amplifiers run with an under-load supply voltage of more than 12.5 volts. With all that in mind, it's easy to see why a pair of 455s deliver more than 120 peak watts. You have to understand that amplifier output power is dependant upon input power and supply voltage. In simple terms, the higher the input power and/or supply voltage, the higher the amplifier output. With that in mind, it's easy to see that the output of a CB amp that uses a pair of 455s will be higher than 120 peak watts. In my experience, the typical output from a CB amp that uses a pair of 455s is 150 to 220 peak watts.

(1) Motorola RF Device Data (Rev 4); page 2-653 (see graph).

On Sun, 8 Aug 1999 19:17:07 -0700, "Mr. 137" <ac137@iwvisp.com> wrote:

*Actually, Gary, you and Mr. Lucas are correct but then not totally correct.
*First of all, on paper, CAPs usually provide for initial current draw and
*sustain for a period of time until it reaches its load capacity (voltage
*drop). Then the charging system feeds the CAPs and (depending on what farad
*capacity the CAP holds) the CAPs voltage steadies. Now, when hooked up to a
*keying-type amplifier, it does the same thing. Although the intial surge of
*amperage draw is "helluvalot" more than a commercial audio system, (if the
*vehicle is running) the mobiles charging system will kick in and sustain the
*CAP and battery's charge. Speaking through experience, CAPs is an excellent
*idea for surplus amperage/voltage storage. In all intents and purposes, it
*is a battery but doesn't hold any reserve amperage.
****

For all intent and purposes a cap is not a battery. Never will be!

****
*Why would hi-performance mobile stereo owners put CAPs in-line with their
*amplifiers and batteries if they knew it would drain and not hold any
*voltage/amperage to sufficiently run their stereo system? Usually, sound
*systems are played for hours on end. You rarely see any stereo system
*fanatic turning off their stereo just to charge up the CAPs and/or
*batteries.
****

Audiofiles use them in car systems to ride peaks. Due to the physics of a
capacitor, it does not like instantaineous changes in voltage across them. When
the voltage across a cap starts to change the cap releases stored energy to try
and maintain a constant voltage across it. Caps alone will not solve the problem
of voltage sag when the peak current demands of the load are to great for the
power source feeding the load, the voltage will still sag. If you are already
overstressing the power source, a cap will do little to help. If the power
source is at optimal or less, a cap will help in preventing small sags in
voltage when large peak currents occur. In audio circuits, the claim is that
distortion is incurred when peak currents are seen. Thus the caps help in
reducing the distortion. In RF application the line regulation for an amp can
handle sags in voltage of up to 5% with little ill effect on the distortion
produced from the amp. With audiuofiles wanting less than .1% distortion, they
demand that the power source be as constistant as possible. Thus they add caps.
For RF they will help in some cases. In most cases they really are a waste of
money. If your line voltage sags more than 5% in a mobile situation I suggest
that the wire carrying the current be beefed up as to handle the load currents
or the power source have sufficient power hanling capabilities.

You can mount the mag mount directly to the paint finish. It would be better if the mount comes with a rubber boot. You will probably have some paint discolloration in any event but it doesn't happen as fast with a rubber boot. You can fish the coax through a door, most cars have a gasget with enough room to not cripm the coax too badly. Through a window is better if you can do it without crimping the coax. If you are going to run power you will need to do some other things. Let me know if I can help further.

Not sure if the number is correct, but in most cases the talkback is achieved by cutting one leg of D-78.
It is located on the right hand side about half way back, about 1 1/2 inches to the left of the audio chip.
I believe it is a clear diode with red in it.
Check to see if this has been cut or remove, if so replace or solder it back in place. This should get rid of the talkback.
Hope this helps...

My 2 cents:

If people enjoy them and like the sound, who cares? I happen to like the sound of clean well-adjusted echo.

The goal of CB'ing, aside from maybe getting driving info, is to have fun; CB'ing is not a particularly efficient method of communication. If my only goal was clear communication, I'd get a ham license or send someone an e-mail, or maybe EVEN CALL THEM ON THE PHONE!.

I think a slightly overmodulated signal with a touch of echo sounds cool as hell. I have bigger complaints about the losers with big base stations hogging up channels 19 and 17 instead of taking their conversations to another channel, they make it difficult for everyone else to communicate, have fun, and get traffic info. As far as I'm concerned, it's sort of the airwaves equivalent of dumping one's garbage in a public park.

For the first time in many years, I did some trucking on the I-5 corridor last week, and I was amazed at the number of loudmouth jerks with big base stations screwing everyone up. These guys really need to make some real friends and get a job, instead of spending all day and night ruining everyone else's fun.

Echo? Who cares?

--Just my 2 cents--

Do you mean, one more time incorrectly?

: It has long been an ITU regulation that CW is required for a license to operate
: hobby-style radios below 30 MHz. FCC rules must conform to International law.

It is not "International law". It is a set of rules that are agreed to by the members of the ITU (International Telegraph Union). You must abide by the rules to be a member.

The FCC and the US is entirely free to ignore those rules if they wished. The result would that they would probably be ejected from the ITU. This is not going to happen, as the US WANTS the ITU to have as much force as is possible in the rest of the world. You can imagine the havoc if every country decided to set up their own frequency bands. All of a sudden, the Ham and CB bands might be swamped with the signals from gigawatt religious broadcast stations during any skip periods.

It is only a 5MHZ audio scope. Not much for trouble shooting or repairs but it can show you your modulation peaks. It only samples a small portion of your audio from the coax line. It isn't real accurate on cb frequencies. It was made to go with the B&K 2040 signal generator and the B&K 1040 service center . The units were built to all go together as an entire set (as well as the B&K frequency counter but I forget the # on it) All the items work well together in this set but the scope is kind of a joke, The weak link in the chain if you will. It will work but isn't to much help in trouble shooting. There are much better scopes that work alot better and have much more potentional as far as repair work on cb equipment is concerned. If you have the entire B&K set you may want to hang onto the scope as a matching piece but actually use a beter one with all the other pieces of equipment . I do have the entire set but do not use the scope. I use a Tektronix 465 which works very nicely with the rest of the B&K test set.

Actually, NOT correct. The SWR has to be the same, everywhere along the length of the coax. If this were not true, then you could match your antenna by changing the coax length.

The readings from simple SWR meters will be different when you vary the place you perform the measurements - due to the current and voltage nodes that exist on the coax.

Make sure your squelch is not turned up too high - or the volume set too
low. If neither of those are the problem, then you need to get the receiver
checked out at a good radio shop.

Simple fix, You have a 5 pin mic plug reverse pins 2 and 4. What ever is on pin 2 right now put it on pin 4. What ever is on pin 4 put it on pin 2. One of these pins may have nothing on it. If thats the case then make the other pin have nothing and put the wire on the now vacant pin. It's a very simple fix and a common wireing problem that many people do to that chassie. It will recieve fine but when you turn up the volume, the louder you go the more it will "Howl" back at you making the recieve audio hard to decipher.

They are decent radios provided you don't rely on the rubber ducky
antenna it comes with. If it's just for fun and so forth, don't spend
lots o moolah on trying to get one with SSB. These GE handhelds can be
found at a few places, but the rebateco is the cheapest (long term
anyway).

Search and seizure is search and seizure. It
matters not what gov't agency you work for. The
constutution makes no provision for exceptions to
that rule. Every citizen of this country has the
right to certain due process. And I for one will
refuse entry to any enforcement officer of any
branch of gov't who can't show me in writing that
this due process has been followed. IE, a search
warrant.

Inspecting my station is very different from
entering my home. And it has nothing to do with
illegal substances or items as you intimated.
That is typical liberal thinking that assumes that
just because someone wants and holds dear their
privacy they must have something to hide. I for
one resent the idea
of a gov't agency who DOES NOT answer to the
voters having any power to do anything at all.
Since Clinton has been in the white house things
have gotten worse. I'm sure you've noticed the
increase in your phone bill. This is due to a TAX
that was levied on the American people without us
having a single opportunity to vote on it. It is
a tax that was NOT approved by congress which the
constitution says must happen for any new taxes to
take effect. And what's even worse, part of the
FCC's rule that applied that tax stipulates that
the long distance carriers can't tell us the real
reason why that increase happens. They were
forbidden from itemizing it on the bill as an FCC
charge and were also prohibited from telling us
the truth about the charge if we call them up and
ask. This is just an example of what the FCC has
become. And I will do everything within my

constitutional rights to hinder them in any way I can. Even if the only thing I can do is make them get a search warrant before entering my house.

No law superscedes the constitution. At least
that's what the founding fathers of this country
intended. Unfortunately, decades of liberal rule
has brainwashed the people of this country into
thinking that the gov't has the power. That's
what is so terrible. No one rules without the
consent of the people. That's why liberals are so
determined to disarm and otherwise rob the people
of their individual liberties. They know that the
people of this country will never sit still and
allow them to go much further. So they are trying
to disarm us to make sure we can't fight back when
they come to our homes and take our property, for
thier own needs, try to silence our ideas, and
other things that criminal despots like Clinton
tend to be involved in. I wouldn't be the least
bit surprised come 1/1/2000 to learn that Clinton
has used the so called y2k crisis to declare a
national emergency. That will allow FEMA to take
over the gov't and suspend constitutional gov't
ensuring that Clinton never leaves the white
house. That's the only thing that will allow him
to keep that which he most desires. Power.

Care to explain why I'm wrong, Bill?

INTERNATIONAL RADIO REGULATIONS
Article 32--Amateur Service and Amateur-Satellite Service

Section I. Amateur Service
Paragraph Three, (1)
"Any person seeking a license to operate the apparatus of an amateur station shall prove that he is able to send correctly by hand and to receive correctly by ear texts in Morse code signals. The administrations concerned may, however, waive this requirement in the case of stations making use exclusively of frequencies above 30 MHz."

Source: International Telecommunications Union
Quoted in The FCC Rule Book, Appendix 2

>The FCC and the US is entirely free to ignore those rules if they wished.

ARTICLE 32--AMATEUR SERVICE AND AMATEUR-SATELLITE SERVICE

Paragraph 5(1)

"All the general rules of the Convention and of the Regulations shall apply to amateur stations...."

Bill says:
>The result would that they would probably be ejected from the ITU.

BINGO.

Bill says:
> the US WANTS the ITU to have as much force as is
>possible

Another BINGO. I see Mr. Nelson DOES understand the concept at work here.

Bottom line:
Morse code proficiency is required for frequencies below 30 MHz because of an ITU regulation. Someone asked about this earlier in the thread, and that is still the answer. Mr. Nelson can play "lawyer" all he wants, but the facts don't change.

Until amended, International Rules require code proficiency for amateur station applicants, but individual governments can waive this for licenses which allow operation ONLY above 30 MHz. The United States exercised this option several years ago with a special license category.

IN CONCLUSION:
That which I posted was a sincere effort to provide concise, accurate information without turning this into a boring legal piece with more details than anyone wanted or needed. That's as far as I wish to go with this. However, I agree with Mr. Nelson concerning the havoc that would result if international cooperation and agreements were suspended.

I paid $74.00 for one here in NC. They have them at Copper Electronics
for $59.00. Check it out

http://www.copper.com/online/box.cgi?name=W30-05004&add=Add+To+Order

I have also used the K-40 Mag Mount. It is also a good antenna but I
like the Wilson better. Both have an adapter on the connector so you do
not have to run the big PL259 connector during the install. Both allow
for easy removal of the coil/whip from the mag mount base. The Wilson
also comes with a cap to install on the exposed base threads.

Be careful buying any used antenna. Be certain that you can adjust for
a good SWR before you give any money. Sometimes the coil can be damaged
and not completely open. Either of these antennas should be tunable for
an SWR below 1.5 on channel 20.

The K-40 seems to be better on the lower channels and the Wilson on the
higher channels (SWR).

I usually dont use the Spell check because the machine (software) loves to make suggestions which I prefer not to use and I prefer using My own words to convey a sentiment. In addition, not using spell check is more like the "written word" thus "Let the mistakes fall where they may".

As far as grammatical content is concerned, inconsistencies and missing words are usually what happens when I get involved in something else during a post, and then come back to that post for completion. Life in the 90's.....no time to smell the roses.

it is d80 it is located behind the filter from the power input from 12
volt you can see it on the right side of the radio in the rear just to
the right of the audio amp that is mounted on the side of chassis

at the rear doesn't really matter

I just stick with 1/2 wave mults everywhere and the 24 feet makes plumbing
a longnose an easier approach

If you are running something in the rear then

I would go 12ft to driver 3,6,9,ft to box then 12 feet to rear hot or shorter

there are also different lenghts you can play with between the hots

I might be wrong in my set up,

if so someone HELP

In this electronic world, you are what you write. If someone is to be taken seriously, they need to be able to convey their ideas so that the reader doesn't have to work too hard at reading it. Everyone is entitled to an occasional typo, but some of the guys here display their level of education every time they hit a key, and it often appears to have ended in the third grade. I do use the spell checker but hit the Ignore button alot, and more importantly, I read what I typed before I hit the Send key.

listen up folk's the fcc is going to rewrite the test to be taken to
get your ham ticket. 1st of all you must live in a mobile home in a
bad trailer park.
2nd you must be as stupid as a retard
3rd. you must post all of your cry baby thought's in a newsgroup.
4th. you must have completed at least 6 years of school.
5th you must no how to bitch and complain about others.
6th. you must no how to preach to others about all the right's and
wrong's others do that is none of your business
7th the real good one , you must no how to complain to the fcc and the
arrl about what other's are doing and not what you are doing god for
bid you are the best.
8th you must be completly brain dead.and have to be forse feed.
9th you must have had a ham ticket in the past 10 years in order to
get the new ticket
10 th why don't you ham's go get a real life and leave everyone else
alone, oh i for got you are a bunch of ass whips allready.
i think we should all go to your newsgroups and bitch about the way
you guy's are talking and the selling of amps to none ticket holders
also you punk's need to look in the mirror and your own back yard to.
so if any one of you ham boy's post to this thread you must have the
need to redeem yourself.
so let this whole thing dye and go back where you came from.
people are tired of it now. and you don't want to start a war you will
not be able to finish.

What difference does it make if you refuse the FCC and they come in your home and see the drug, they still have no right to do anything about it. If the FCC even gets a warrant it will only be for illegal radio equipment they have no right to even get a warrant for anything else.

>not be able to finish.

Sounds to me like you are the one always "starting" things. This is the third....maybe fourth...inflamatory anti-ham thread you've tried to start in the past 30 days.

I will agree with you on one point. People ARE tired of this #%$&. They came here to talk about CB--not to sit around and bash hams.

Besides, it seems to me that this would not be a good business move for somebody who sells CB and Ham radio equipment (as you claim to do). A lot of CBers are hams--including a growing number of truckers. You think they are gonna give up the CB gear, just because you think a ham license is like having some kind of disease? Think again. They use the CB as part of their job, and they're gonna keep it.

They also talk among themselves. How much of your customer base can you afford to have ticked off by your attitude?

Yes, people are tired of this bashing. That's why you no longer see the 250-post threads like you used to be able to start. The folks here are wise to what you are trying to do, Mr. WildcatRadio.

I picked up a old Teaberry Stalker Two for a couple of bucks at a yard sale. It only transmits on lsb. I opened it up and one wire from the selector switch (orange), and onother (grey) from the board has been disconnected from the board.

There is now a small orange wire ? the one cut on the board with a 2k resistor between it and another wire where it looks like the grey cut wire went. There has also been a channel mod done. Does anyone know how or where I can get the info to correct what what done so i can see if I can get this rig working.

Thanks

> Where does the voltage drop? Between the alternator and the batteries
or
> between the batteries and the amp?

I hardwired and mounted a volt meter to the top of the amp. It shows a constant voltage reading (so long as the possitive and negative leads are connected to a power source). So the only point at which I have taken a reading is at the amp.

>
>
>

Depends on what you mean by bandwidth. Typically this means Freq vs SWR. It could also mean FREQ vs gain or FREQ vs FB ratio. Typically the freq vs gain bandwidth for a yagi is about twice as wide as the freq vs swr. This being the case you could use a tuner with your setup and easily cover 1Mhz with good performance of the system.

i go shoot photos deep in remote mountain areas....a recent event with wildlife has prompted my interest in some kind of communication with the outside world, should something happen.

i was hoping someone could recommend a radio that has the power and range i may need... yet will cost me less that a couple hundred bucks?

any input will help, but specific models may help in my online purchase. also..if someone could recommend an online store..... that would help too.

thanks....lewis

Quote the poetry correctly at least.

Self-Pity

I never saw a wild thing
sorry for itself.
A small bird will drop frozen dead from a bough
without ever having felt sorry for itself.

D. H. Lawrence

The poem was used in the movie G. I. Jane.

Now go troll somewhere else.

Thats the problem..... VERY FEW people have a clue how to adjust there echo.... MOST of the idiots over do it and sound like shit.

And as far as BIG BASES on Channel 19 ... How about the asshole truck drivers that run 1000 watts to talk truck to truck with there squelch all the way up so the do not hear the local traffic that they are bothering ?? There is a lot more of them then big bases on 19 !! They're almost as bad as those skip niggers that bleed all 40 channels...then youfind out they are 10 states away !!

MY 2 Cents worth !

I had a 6 AWG wire going from my LARGE fuse block to my amp. (7')
I lost 3/4 of a volt from one end to the other. Replaced wire with
a 4 AWG lead. Voltage stays the same on both ends now. I will be
upgrading grounds and power leads. Killed my old alternator last
week and I was surprised that the main feed wire from my alt. is
only 10 AWG. Two feet of that to my battery. Cleaned every connection
including the mount points and got rid of about 1/4 ohm of resistance.
(that's 12 amps more current capacity)

Could you possibly learn how to spell:
no = know
forse = force
dye = die

Capitals belong at the beginning of a sentence. A period belongs
at the end of a sentence. Be consistent in your punctuation. It
makes your posts easier to read.

Pick the proper homonym:
there - their - they're
your - you're

(Sorry. I is a high school graduate :-) (a sentence you mite understand)
(misteaks on porpoise)

1254. Temporary setup / noise

Newsgroup: rec.radio.cb
Date: 1999-08-10 00:00:00 UTC
From: paul@nospam.com
Message-ID: <37b08104.26681546@rtpnews.raleigh.ibm.com>
Source record: 1254

We are fixin to make a trip in the wifes car, so before mounting my new uniden 510xl in my truck, I got a cigarette plug adapter from radio shack and a wilson 1000 magnetic antenna and just kinda temporarily hooked everything up in the car. I notice that if there is no real signal coming in and the squel is down, I get engine noise out my radio. Is this normal or is it because I am pulling power from the cigarette lighter ? I've heard that if you pull the power from the same line as the car sterio, you get some noise filtering...is that true ? Thanks. (had it on coming into work this morning, so far it seems like a pretty good little radio).

-Paul

The fuse block might be your problem. Run directly to the battery, with fuses
of course.

You should look in to the Cobra line. I' ve had a Cobra 25 LTD for about ten years and have had no problems with it. The radio sells for around $89.00. These radios are very basic but they are great talkers. Bills -2way or the Coaxkid sell them. Some of the guys out here can give you there web site.

You have connected to a central point for the electricity but you are
also going to pick up any noise generated by other components. For a
temporary situation you can live with it, but when you install the radio
permanently, wire it directly to the battery, both positive and negtive,
and fuse both wires under the hood. It will make a world of difference.

Lewis,

I go 4 wheeling a bit and I always find that the CB is helpful.
However, we are currently in a sun spot cycle and it is only getting
worse, this means a lot of noise during the daylight hours. Sometimes
the noise is bad on into the night. Range can be limited to a few
miles, however someone 3000 miles may hear you.

Anyway, I highly recommend a CB but I would also consider a cellular
phone if you have service available in the remote areas you mentioned.

1265. TRC-474 uniden equiv. or mods? (Also no TX)

Newsgroup: rec.radio.cb
Date: 1999-08-10 00:00:00 UTC
From: tape_trader@my-deja.com
Message-ID: <7oq52cvod1@nnrp1.deja.com>
Source record: 1265

Maybe someone can help.. I have a TRC-474 that has been lying around for a while. I put it in my truck recently, and for a while it worked. The other day it quit transmitting though. The modulation light doesn't come on or anything, but the led's work for recieve strength. If the final tramsistor (2sc2166 on this) went, would the mod light come on? I could replace it & see if it works. What is the unides equivalent of this unit? The board is marked Uniden, PA-206AB - is this a model they made? Are there any mods for this unit? Someone suggested replacing the 2166 with a 3133 for more power, but the power is fine already. Anything else?

Later..

1. Galaxy DX-949 with channel board, peaked, ready to go.
Roger beep, swr, power meter, talkback, all built in. Comes
with all original accessories, i.e. stock mic, box, bracket,
box, power cable, etc. $100 shipped. 22 watts out on SSB

2. Ranger RG-99, mint condition, used little. With D-104 M6B
mic, and all original accessories. $150 shipped. The mic alone
is worth 40 bucks, also has the FC-390 external counter, [will
not sell the counter seperately.] 45 watts out on SSB.

3. Uniden Pro-810 40 channel SSB base station. Very clean condition
$90 shipped. 20 watts out on SSB.

All these radios are in excellent cosmetic condition as well as
excellent working condition. Must sell so that I can purchase my
new radio.

Most drop seems to be in the wire running + to the amp. Don't forget a
good
ground. Resistance there is worse because it can lead to ground loops.
Current will flow through shields and other places it shouldn't.

After seeing the newsgroup change from a help group to a chastise the CB'er newsgroup i decided to do some research.

I organized all the posts by author. Then i read the posts and tried to discern an agenda. That agenda being to put down CB'ers or the service as it exist today. I then came to a list of authors who obviously enjoy putting down CB'ers or the existing service at any opportunity. These authors in my opinion do more harm with their self righteous behavior than good. Therefore i present the kill file list for anyone to use as the real cleansing agent that this group is in dire need of. Here it is.

The meter is inaccurate, and it's best if you make
wattage measurements using a dummy load rather than
an antenna. Any SWR (reflected power) at all tends
to skew wattage readings. Your test set-up is
showing the dead-key too high and the peak too low.

Again, if you can find some time, read the AM Tutorial
on my website; it goes into all of this in detail.

Hello RHOOLIGAN2: One of the problems not mentioned here is with the watt meters. Like on a Bird model 43, like when the 1000 watt slug is installed, and the meter movement gets pegged without the amp or transmitter being totally tuned up, what ya do?

U cAN buy a new 2500 watt slug, but then you would want to pin it again. And that would require more pills, then a few more alternators, or another 3CX800A7, right!

So what do ya do? Will I learned on the ng here, that you could carefully pull the slug out de-sensing the full meter reading, allowing the transmitter or amplifier to be tuned for max. Ain't this great!

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station. Miss Dinah down the road at the fillin station, has two brand new Bird 2500H slugs fer $99.98 American dollars. But ain't no one never bought one.But she did sell the new 3CX800A7, go figure!

Brass, If you are trying to achieve the 2 Hot antenna system better known as the "End Fire" array which will concentrate your signal in one direction you will need 12' of coax, the 66% velocity factor type to the front antenna and 6' of coax to the back antenna, this can then be run into a tee with any length coax you need to reach its final destination. The antenna element spacing is on the order of 1/8 wave or 1/4 wave, 6' or 9'

Do you know what a "truth chart" is? If so, get one for that
radio and start checking the programming pin logic against it.
You'll find that there's a short or an open in one of the
programming pin circuits. The reason for the short or open
could be a bad channel selector switch, a broken wire, a
botched mod, a cold solder joint, etc.

A service manual or Sams Photofacts for that radio will have
a truth chart in it. Sams Photofacts are available for free
lending and/or photocopying at many public libraries.

Okay. This most certainly sounds like the channel selector as aforementioned. Either that, or it is a pull resistor. Though, I would look at the selector first if it were on my bench. Still dont have a brand/model to work with... <grin> But, try retacking the solder joints on the PCB (for the channel selector rotary switch). Let us know how you made out.

Dave,

Sound like he already has damage.. <grin> Hmmm.. Well Greg, as Dave mentioned this is the (A)ntenna (W)arning (I)ndicator, which DOES signify unusual high VSWR. Therefore, as Dave mentioned you most certainly do have a problem in the antenna system. Though, I have seen these go on, when the antenna was fine, but the pre-driver transistor burnt. I would recommend taking it to a tech.. Unless you have some electronics experience (not just measuring voltage)... Let me give it some thought, and if something new pops in my head, I'll post again... unless replied to.

When speaking of antennas, you're right. When speaking
of dummy loads, you're wrong. A dummy load is almost
worthless if it doesn't present the *exact* resistance
that the radio is designed to load into under ideal
conditions. If a dummy load shows a 1.2:1 SWR, chances
are it's been overheated to the point where it's
resistance has permanently increased. That means it's
ruined as far as being part of a highly accurate test
set-up. To verify, simply measure the dummy load's cold
DC resistance. A 1.2:1 SWR means the cold resistance
is likely to be around 60 ohms rather than 50.

In my 20 years in the hobby I've ruined a few dummy
loads. It comes with the territory. Just suck it
up and buy (or build) another, bigger one.

To answer the original author's question; yes you can
still use the damaged dummy load to tune the radio.
Just keep in mind that the wattage readings will be
somewhat skewed. Given that you're using a Dosy,
that doesn't really matter. Just tune for maximum
wattmeter needle deflection with modulation and
disregard the actual wattage reading.

As far as the generator (transmitter or amplifier) is
concerned, it is. If you want to play, we can get into
that more later.

> it is the same all along the coax (disregarding
> minor coax losses). No multiple is 1/2 wavelength coax is required.
> Listen to tnom@muck.net. Stop farting with coax length.

You didn't thoroughly read tnom's post. He accounts
for the fact that the "system" (coax and antenna combined)
SWR does change (if the line is not flat) with coax length,
and that certain transmitters (especially those with less
than unconditionally stable amplifiers) will react differently
to the load presented to them based on changing coax lengths.

In any case, I'm glad to see you posting again. Perhaps
we can get back into some of our old, lengthly (and painful)
debates over things like amplifier biasing. :-) I've
learned a few things over the last year or so that should
make my arguments even harder for you to stifle.

Source record: 1344

Last I heard, the SS225s were using SD1446 transistors. Even with
weak radios they'll peak in the 180 to 225+ range as long as the
DC supply voltage is adequate.

In any case, my original statement applies. Using a proper test
set-up (a powered, peak-reading meter or a scope and a dummy load),
if you were to key at 100 and peak at 140 you'd sound so muffled/
pinched/crispy/sizzly that all you'd hear are complaints. If
that's not the case, the only logical conclusion is that the
wattage readings are inaccurate. You have to maintain at least
a 2:1 peak to carrier ratio to sound decent. In this case that's
dead-keying at 100 and peaking at 200, or peaking at 140 and
dead-keying at 70. Keying at 100 and peaking at 140 is a peak
to carrier ratio of 1.4:1--that's so low that there will be very
high levels of audible distortion in the signal--so much so that
some people won't even be able to figure out what's being said.

<<So what do ya do? Will I learned on the ng here, that you could carefully pull the slug out de-sensing the full meter reading, allowing the transmitter or amplifier to be tuned for max. Ain't this great!>>

Better method you might wanna try: get piece of 5" OD PVC pipe and saw off a 14" section. Carefully close-wind 300 turns of #2 insulated copper wire onto it. Solder one end to a copper pipe approximately 30" long and leave the other end bare. Now get a 50 gallon drum and fill it halfway with pickle water (Be sure to use Kosher pickles, Jay) and about 5 lbs. of iron filings. Center a piece of good quality cardboard on the outside wall of the 50 gallon drum and tape it in place with duct tape. Drive the copper pipe down into the iron filings so it stands up straight in the pickle water (holding the coil).

Now attach your coax center lead to the copper pipe. Attach the braid to a bare metal spot on the outside wall of the 50 gallon drum. Now take a pen and write "50 gazillion watts" (or whatever you want) on the cardboard. Sure, it's accurate. Just like the "slug-desensed Bird" is. Have fun.

1352. Antenna choices

Newsgroup: rec.radio.cb
Date: 1999-08-11 00:00:00 UTC

Message-ID: <7oqvbj$ln5$1@news1.cellone.net>
Source record: 1352

I don't know if anyone remembers my earlier post but I have some more questions. I also know this might stir things up so I'm wearing my Nomex. Ok I finally picked a radio, and I need an antenna. I know the bigger the antenna the better, but I'm not really looking for extreme range. I don't want a large antenna, and I don't want a magnetic antenna, I kinda just want it to work decent. I was leaning more towards glassmount or AM/FM/CB. I like the idea of using my existing AM/FM. It's a 3ft antenna and it receives very well for the radio. I found the adapter to use any AM/FM for CB, it's made by Valor, and it has connectors, and a matching adjustment on it. Now I heard from a guy in the biz that using an antenna adapter like this burns up CBs. Is this true or false? Also I found a few glass mount antennae from several manufacturers. Most of these come with a way to match the antenna, cables, and connectors. I found one that was a "true half-wave" 10/11 meter antenna from Solarcon, and others from name brand manufacturers. Given these two choices which is the better of the two? One would be placed at the rear right corner, the other would be fairly centered, and highest point. Any insight would be appreciated.

1353. Another "ham slamming "posting?

Newsgroup: rec.radio.cb
Date: 1999-08-11 00:00:00 UTC
From: Tempola Music Rolls <tempola@i1.net>
Message-ID: <Ui9s3.141$AF.57219@news1.i1.net>
Source record: 1353

O jeez.....god help me.

I read and read and read.....postings.about those "lousy ham's",
and "Those lousy Cb'er's
Geez.....get a life people!

Here's the facts.

There are always undesirable people in both groups. some of the amateurs
that hang out here are often despised by their peers.....so they come
down here to "impress" the CB'ers. conversely, some of the CB'er's post
back.telling them off.....THIS IS EXACTLY WHAT THEY WANT.

These "hams" do not represent the hobby at all.....they are not the
mainstream, so don't throw them all in one basket There are some really nice
and helpful amateurs out there, who deal everyday with assholes like this .

Remember the potty mouthed CB'er who likes to start trouble and throw
carriers? Consider the trouble making ham of the same cut. He is just as
much an embarrassment to the amateur community as well. They won't tolerate
his actions, so he just wants to take it out on CB'ers.

To those few trouble making hams I would say this: If you think all CB'ers
are sh**t......what are you doing here? Has your peers made you feel
unwelcome on the amateur bands? Wonder why? I would not tolerate a Marxist
attitude on any frequency!

CB'ers, don't flame these trouble makers, greet them with silence, just like
their peers do. Fact is, radio theory is the same if it's on 80 meters or
11.....nothing to crow about. .

This "brother better than you" attitude has caused Ham radio to drastically
loose numbers. when the old guys die out, who will carry the torch? The ARRL
is not much help.....they are throwing out the baby with the bath water,

Cheers

1354. Re: FCC Again

Newsgroup: rec.radio.cb
Date: 1999-08-11 00:00:00 UTC
From: Green Dragon <grndrgn@zebra.net>
Message-ID: <37b138fd.0@monster.zebra.net>
Source record: 1354

heheh.... Dude, If you don't see the possibility of such a thing going down then you're blind. Here are the facts:

The FCC (among many other such agencies) doesn't answer to the voters.
Clinton and his administration have used them to levy taxes on us without our consent or even the opportunity to object and then tried to hide it from us by forbidding the phone companies from telling us why our phone bill went up.
If Clinton (or someone like him) ever does decide to put a limit on our means of communication the FCC will be the way it's done. Just like the BATF (another federal agency that doesn't answer to the voters) is the primary means of oppressing gun owners.
Clinton recently signed into law an executive order increasing the power of federal agencies like the FCC, BATF, FBI, FEMA, etc by giving them the authority to ignore state and local laws if they deem necessary. This executive order even gives them the authority to MAKE LAWS when state or local law doesn't allow them to do what they want.
Since 1952, conservatives (both republican and the rare conservative democrat) have tried to pass an amendment to our constitution that would spell out clearly and in writing that no law, treaty, or other activity on the part of the federal gov't could superscede the constitution. Such an amendment would protect for all time the bill of rights and other sections of the constitution that are constantly falling under attack by liberals. Every time this amendment has come up liberals have philabustered, attached unacceptable riders, and engaged in other low tactics to prevent the amendment from passing.
Clinton has signed more executive orders than any other president in the history of this country. He repeatedly circumvents the will of the people with these executive orders by using them to make laws that he either failed to get congress to sign off on or knows up front that congress will never pass.

Here's an excerpt from an article about this executive order:
<quote>
Last year I wrote an essay on EO 13083. You can click here if you want to review it.

Bill Clinton set off afire storm when he signed it in May 1998. The order gave government agencies greater power to establish rules and regulations without requiring that pesky Congress to approve them. These rules and regulations would override and supercede all state and local laws and regulations. EO 13083 died when governors, mayors, and intelligent individuals raised absolute hell. Clinton suspended the order shortly after the National Governors Association expressed its opposition.

Well, it seems EO 13083 is not dead after all. David Bresnahan of WorldNetDaily reports that there is a new, revised EO on the table. Clinton signed the order yesterday. It is titled" Federalism" and has not yet been assigned a number. Clinton claims that state and local government representatives helped him to revise it. The new version is slightly more palatable than EO 13083, but there are still some Mack-truck-sized loopholes that allow federal agencies to do whatever they please. Pretty sneaky. The first time this came up, talk radio and the Internet were instrumental in spreading the word to the public. Fifteen months ago we learned that Bill Clinton was willing to sneak EO 13083 past the American

people to expand his own power base. Should we be surprised that he's trying again with a more polished version? It may look better, but it still stinks. Clinton's hoping again that you'll be too distracted to care. As Clinton aide Paul Begala said of Executive Orders; "Stroke of the pen, law of the land. Kinda cool." The new EO takes effect on November 4, 1999. Get that dialing finger ready and call your representatives in Congress.
<end quote>

These and other attacks on the Constitution and the limitations it places on the power of the federal gov't must be stopped. Already, if congress doesn't act immediately (and it's real convenient that Clinton signed this new order while Congress was on vacation) Clinton will have all the power he needs to enact the FEMA scenario that I mentioned in the previous post.

Yeah Rhooligan, go ahead and keep your nose buried in those comic books. Ignore the tactics of the Clinton whitehouse and see how long it takes this country to become the newest dictatorship on the block.

>on the line, why skimp?

The problem with EPIRBs and their lower-tech ELT brethren is that the satellite system doesn't notify AFRCC until two passes...so this device has to be activatedfor a good hour or two before anybody will even begin to THINK about starting to look for you.

If cell phone service is available in the area, that would be one way to go. If it isn't, then satellite equipment would have to be considered. Yes, it's expensive, but if your life depends on it, any price is worth paying.

I also wouldn't even think of going out in bear country without a suitable firearm that is capable of dropping a bear if the need arises. I imagine a rifle wouldn't be too handy what with having to carry photographic equipment already as it is, but a good .44 Special or preferably .44 Magnum will stop a bear if used with some competency...assuming local law allows carrying same. If not, that rifle might just be worth the bother.

Do not go with a glass mount. I have tried several (even ones that can have the swr tuned) and NONE work as well as an antenna mounted on metal. I would suggest a short 2' fiberglass whip (Wilson silver load) and either a trunk mount or roof mount. If you keep the car in a garage, a trunk mount or the roof mount on the trunk).

I dug out my old Radio Shack TRS-455 40-channel 5-watt base unit last week and bought one of those back-of-the-set antennas from Radio Shack. I'm afraid to key the thing up -- with that antenna, am I going to interfere with the neighborhood TV sets? Will my CB blow up? Am I going to tap into some secret government channel and have black helicopters landing on my roof? It seems to be receiving just fine. Especially when the skip is in. It's been over ten years since I ran this thing, and I could swear that same guy down in Oklahoma has been yawping about how good he gets out for the whole ten years...

Seriously, can I expect to spread interference with the back-of-the-set antenna? I need to know, some of my neighbors own assault rifles. :)

check the audio output transformer or the anti-spike diode next to it.
if it is either, you loose modulation.
if it is the diode, it is next to the transformer. replace it with a 1 amp @
50v or higher part.
look at the bottom of the circuit board for a trace that connects a black diode
to one leg of the transformer, (both are on top). replace it with the same
polarity as the old one if it's bad.
as for freq mods, if it's the one i'm thinking of, i think it has a uPD-2824c p
l l.
if so, you can get an expo-100 kit for it.
if i'm wrong and it has a tc-9106 p l l, there's no freq mod for it.
good luck.

Yes, on AM you can tell when someone unkeys because you lose the carrier, but on SSB it can be difficult to tell when someone unkeys. It helps prevent doubling.

yes i wrote that but it wasnt my question. i know the answers and i didnt find them in a radio shack study guide either. 73 tim

ps. how come almost every ham that comes to this cb board is only a lowly tech? seems to me there not thru with 11 meters yet. i guess they cant get away from the fun.

Have old Teaberry "T" Control base unit from 1977. I have lost the original manual.
Xerox copies are fine. Acrobat3 Adobe files O.K. also.
Willing to compensate.

Thanks for your responses.

I'm delighted that you kept someone in a job by squandering money on 'big ass fuses' and gold plating. You still didn't get the point that you can have voltage loss going through the buss, and the shortest distance to the source of power is by going directly to the battery itself with as short and as large of a multistranded wire as possible.

Local Author would like to interview any Caucasian who owns a CB radio and has been on food stamps, received welfare, received disability for a fake injury; anyone who rents a home-on-wheels, who owns a car or truck worth less than 1,000 dollars, who has few or no teeth, who has a GED, who drives a truck, bus, or trolley for money, who beats his wife sporadically, who can't hold a steady job, who is over 40 and has never been on an airplane, who has relatives busted for drug or alcohol related offenses, or any and all of the above.

Will pay money to find out what the life of the White Trash American on CB Radio is all about, e.g.; How to avoid payment of social security taxes, how to cheat the IRS, how to get arrested for DUI or Drug related offenses, how to have babies out of wedlock, etc.

Submissions and stories will be included in a new book entitled:

White Trash in America: CB Radio as a Way of Life

Subjects who submit to interview will receive a coupon for a new Cobra 2,000, or a new set of false-teeth, their choice.

The AWI has always come on, no matter what antenna I tried it on. It used to be on a fiberglass whip on a loong cable run (with a few splices) so then I figured something was wrong. It was used infrequently so I didn't worry about it. Right now it is hooked up to a mag-mount, and it was used a few times with a RS set back antenna when the old one was ripped off.
I do have a bit of electrical experience, but right now don't have access to most of the equipment. (Electrical Engineering Tech. student, labs are shut for the summer)

Thanks again
Greg

OK, seriously, I opine thusly: CB would be a poor choice to stake your life on (hence my ironic humor).

How about an EPIRB (emergency beacon) transmitter? Range is not a problem since they are tracked by satellite. There are a few EPIRB mfrs on the net you can get info from. It may cost you a bit more than $99, but when your life is on the line, why skimp?

>the premise of this search because he wasn't looking for "a joint",

The cop cannot pat you down unless he is going to arrest you or you have given him permission to do so. If he then finds a joint on you, wham, your now busted for possession even if he was not looking specifically for drugs.

If the cop asks if he can search you or your car, even if he has nothing to indicate that you have done anything wrong, and you let him, whatever he finds thats illegal will now be used to bust you. Its fairly simple. The police do not need any warrant when the individual volunteers the officer to look. Anything illegal that is in plain view of the officer at that point can and will be used to bust you.

Now, if you refuse and the police obtain a search warrant, the officer can only look at the areas specified in the search warrant. Still, if there is anything illegal in plain view you will be busted for it.

1405. 23 Channel SSB PLL rig info

I am not sure if an FCC agent has the right to act as a civil law enforcement officer, but I suspect they do. So, if you let them in or they get a warrant to search your house and they see something illegal in plain view, even something they weren't looking for, they can arrest you on the spot. Let it be known that this fact is not a violation of your civil rights. Something illegal in plain view of authorities on your property is indication of a crime occuring. The authorities will handle it the same as any of crime they see occuring.

Need to sell some stuff: ALL PRICES NEGOTIABLE

For Sale:

Cherokee CBS-1000 ----- Barely used (less than 3 total hours)

Immaculate condition- A 9.5 out of 10. Modifications done -5

watt mod, channel mod, modulation mod. Great looking and
performing radio.
BOUGHT NEW FOR $275, SELL FOR $200 O.B.O

13.8 Volt, 3 AMP Power Supply ----- Barely used (no more than 5 total

hours) EXCELLENT CONDITION (9.9 out of 10) Has binding posts
and cigarette lighter adapter.
BOUGHT NEW FOR $45, SELL FOR $25 O.B.O

JOYSTICK - Gravis Phoenix ----- Great joystick for the compuer

game enthousiasts. 9.9 out of 10 (10 of 10 not possible because
it was used some) Use maybe 5 times. Many buttons (I think
about 20 or so- they are all programmable with the included
disk.) Bought it but then a week later bought a cheaper one that

I liked more that didn't have so many buttons.
BOUGHT NEW FOR $100, SELL FOR $50 OBO

Located in Northern Virginia area about 30 miles south of DC. If
interested, contact me at Stobl@hotmail.com

thanks,

73's

Radio Shack also sells the Ball mount and spring. You'll notice that
the ball mount and spring each cost as much as the whip. So, actually
building a complete 102" whip antenna system isn't cheap.

No need to scrape paint. The best place to mount it is on the trunk lid and put the coax into the trunk compartment, then feed it through the backseat into the car itself. This is not the actual best location on the car, that it on the top in the center, but then you have the problem of a wire running halfway over your car and in through the door. This will work but becomes a pain after awhile.

Greetings!

While Dancing with the Modem on 10 Aug 1999 05:42:16 GMT, the Modem interrupted with an MNI from "billn@peak.org (Bill Nelson)", and the MotherBoard buffered this to Video RAM:

:+]jdaggett@gate.net wrote:
:+]:
:+]: Correct. If the antenna impedance is not the same as the feedline, the SWR will
:+]: vary along the length of the coax. One can easily be fooled into thinking a good
:+]
:+]Actually, NOT correct. The SWR has to be the same, everywhere along the length
:+]of the coax. If this were not true, then you could match your antenna by
:+]changing the coax length.

What you are changing, is the impedance of the coax, that is working against an impedance that is different than that of the coax.

As you use specific lengths, the impedance of the antenna is no longer present, the antenna's own impedance combines in a series and parallel combination where you see the coaxial line become part of the antenna system. At these points, it is possible to tune this as an entire unit.

The inefficiency of the unit as a whole does suffer. Due to the impedance the antenna induces to the system, that the coax becomes an active part of the antennas own radiating field.

Depending on how the coax is placed, the coax can actually help improve the efficiency of the unit by offering extra surface area via the use of it's outer shield, and it's overall length - to work like a coaxial dipole. Or a basic coaxial antenna with a tuning stub.

Because most antenna systems for CB radio, use open ended systems that have a center fed radiator, thats insulated from the shield. This presents problems in trying to determine true SWR.

1. the coax at specific key points offers impedance that can vary from infinite, to a dead short - even though the coax is insulated from making contact with both the center or the shield at any point along the line. This is a factor of length in free space, versus length of propagation through a conductor, or velocity factor as determined by the conductors ability to transfer energy from one source to another. The speed of light is finite, so is electron flow, and the distance magnetic and electrical waves travels. The type of conductor is a key point in how long these specific lengths should be.

However, when an antenna is connected, the extremes of the impedances the coax can present, are lessened. To the values of the antenna itself, the sources' own output impedance, and the coax itself.

2. Spacing of the conductors in a coaxial line. The impedance is determined by spacing of the conductors thru the use of a dielectric material. A different dielectrical material - with the same spacing of the conductors, can offer a different impedance. Although in most cases, the dielectrical material and conductors own physical distance from each other, determines the overall impedance into a balanced system. 450 ohm Ladder line, 300 ohm twin lead, are different forms of spaced conductors, however, they should not be confused with coaxial antenna feed systems. Coaxial systems, due to the nature of their use, are unbalanced, the outer shield is considered to be at earth potential, or at least used in this fashion, to gain the benefit of actually having the antenna work to form it's own impedance and offer a means to receive or transfer energy as a balanced load thru the use of an unbalanced conductor.

3. Counterpoise, or earth ground potentials. Many problems arise from coaxial systems that have little means to attach themselves to earth grounds except for attachment to either a rod to earth [recommended for protection] or a floating ground that is not connected to earth but does connect the coaxial shield to an artifical ground, or plate. This offers a means to generate a mirror image, or the secondary conductor to return energy back to the source to make the circuit complete.

Secondary effects, or events, can use impedance matching circuits to always present a balanced load, even though the feed point impedance of the antenna itself is vastly different. An end-fed 1/2 wave length antenna offers an impedance of 1500 ohms, but center-fed dipoles offer an impedance of 72-75 ohms, while a ground plane antenna offers an impedance of 36 ohms. All of the above can be directly fed, but will require the use of matching circuits to meet the expected coaxial impedance for it to be considered balanced.

Problems? Artifical, or floating grounds that have no true ground connections to offer the coax a means to return energy to the source.

Artifical grounds not connected to the shield of the antenna at the antennas own location, the impedance of the antenna is affected.

Mag-mount antenna systems fit this catagory. If you think back to the above coaxial dipole, remember that the antenna "sees" two types of impedances - one of the counterpoise present, but not connected, and the coax presenting an unbalanced complex impedance.

The antenna presents its' own impedance to both of these working elements. Two types of counterpoise are present working against the radiator, or center-connected antenna. In a fashion, a metal plate which is the mounting location of the antenna, can be considered a

free floating metal shield that can develop an opposite charge as a wave, generated by the antenna, passes over this surface. The coax does not care what this shield can do, if the antennas own impedance is affected by the impedance at the point of mounting.

The floating-metal shield, presents it's own impedance to the antennas radiating field, and attempts to mirror it. Our effort is to provide a balanced impedance that is close to the coaxial lines own impedance at both the feed point and source point. Then the coaxial line terminates to a balanced system with energy that is still present in the conductors, both the center and shield returns to the source in exactly the opposite phase, minus the energy expended to generate the waves at the antenna as the floating counterpoise. The waves, as they travel along the antenna and this free-floating metal shield, are considered equal and opposite to each other in this balanced system.

If the antenna cannot present an impedance that meets the expected impedance of the source, the coaxial line then offers a series of points along the line where the impedance varies from the antennas own impedance, to the impedance of the coax, which can be found at certian key lengths.

Since we are using an antenna connected to one end of the coax, and the shield is not connected, the shield attempts to force itself to the potentials present at the source.

The counterpoise, is the coax, as far as the source is concerned at this point. However, what affects the antennas impedance to the coax, is determined by the aspect of the counterpoise, with respect to the coax, and the metal that should be the counterpoise at the antennas location that is not connected to the coax.

To make a coax- based antenna system work in this situation, the length of coax, does depend on the length, or distance of length, the coax is from the source, and the impedance of the antenna and the counterpoise present at the antenna mounting location.

The open-end system, with the antenna acting as a tuning stub over an isolated ground plane system, or counterpoise, the connection point presents it's own impedance to the unbalanced coax. This, along with the length of coax used, the shield of the coax is forced to be used as the sources own counterpoise, with the coax feedpoint of the antenna and it's mirror image presenting it's own impedance. In essence, an end-fed coaxial dipole with a tuning stub with a matching radiator presenting a capacitive and inductive reactance to compliment the antennas own reactance in both a series, and parallel, impedance.

Forcing the source ground or counterpoise, to the same potential as the isolated counterpoise of the antenna, the coax then becomes less of a counterpoise, and can offer a means to transfer energy thru it's own unbalanced feedline. As if you were to connect the radio to the

metal plate, with no concern to length of coax.

There is still a problem though, and that is with the impedance the counterpoise the source ground is now connected to. Location of the radiator [antenna] above this surface, and the ability of this surface to provide the proper impedance, can once again force the coax to become a means in which it will present a complex impedance that is length dependent.

e.g - An antenna, rated for 50 ohms impedance with 18 feet of coax, over a counterpoise that forces the antenna to become a radiator that is now presenting 120 ohms of impedance.

Throw out the coax length, and use an abritrary length - say 14 feet.

The antenna will present a series impedance of 170 ohms, with a paralled impedance of 35 ohms. The SWR, in a rough guess, should be about 2.2:1 - pretty poor, but not extremely dangerous. An energy loss is occuring here.

If we change the length of coax, to say 18 feet. The coax then becomes a means to balance out an unbalanced system.

This is where Voltage [E] and Current [M] waves come into play.

In a balanced system - with both the antenna, counterpoise, and coax are all the same impedance. Then using unbalanced coax, the system sees the proper impedance at any point along the line.

When the antenna itself is not the right impedance, the coax then takes on the role of attempting to balance itself to both the source and the antenna radiator. Even though the coax itself is inherently unbalanced, the extremes that it plays in this system [no shorts please] are at the two extreme ends of the impedances, which are; the antenna, source, and counterpoise, presenting themselves to the coax.

The three basic elements, source, antenna, and counterpoise impedances, affect how the E and M waves propagate thru the coax, and the antenna itself.

In an poorly matched system, the impedances are different.

By changing coax lengths, you are affecting the source length of counterpoise, even though the coax is bonded and forced to the same potential as the source ground. The coax becomes active, and the metal the antenna is floating upon to radiate, is also affected. The counterpoise metal the antenna is above will attempt to raise it's own impedance because of the influence the coax has on the unbalanced feedpoint. Changing coax length, in this type of system [shield left floating at antenna] you are re-creating a coaxial dipole, with the counterpoise radiator that is forced to source ground, becoming a high-impedance path for return energy, and the coaxial shield now has a high voltage peak appearing at 1/2 wave length from the source, and a reflected voltage peak appearing at 1/2 wave from the antenna.

The above might help explain some events...

1. Audio Squeal - excessive RF energy that the coax now must radiate
due to out of phase relationships from forward waves interacting with
reflected waves, inside a high-impedance shell [vehicle], is now
forced to return to the source at any point that will accept this
energy - including the microphone.

2. Unstable SWR - energy values that are equal [low SWR] when the
antenna is left stationary in one spot. SWR becomes poor during
attempts to move it to another location, or simple vehicle motion
causing the whip to move, is changing the relationship of antenna
impedance over a fixed impedance due to location.

3. Trimming coax lowers VSWR. This technique is the key in realizing
that the antenna, and the counterpoise it's supposed to work with, are
not equal. This means that the coax is forced to become a part of the
antenna system and unless the antenna is either tuned or relocated to
a better position, you MUST use a specific length of coax in order to
keep the system stable and not to create situations like 1 and 2 above
- let alone transmitter damage.

Just wanted to throw that in...

:+]The readings from simple SWR meters will be different when you vary the place
:+]you perform the measurements - due to the current and voltage nodes that exist
:+]on the coax.

I believe it stopped being a ham band due to its harmonic relationship with certain TV channels. At this time 3 watts was about all you could do legally. I guess they figured 3 watts on type acceppted equipment wasn't going to cause any harm.

1432. Re: Temporary setup / noise

Newsgroup: rec.radio.cb
Date: 1999-08-11 00:00:00 UTC
From: CodysPC@Iserve.Net

Source record: 1432

Greetings!

While Dancing with the Modem on Tue, 10 Aug 1999 19:50:49 GMT, the
Mouse interrupted with an MNI from "paul@nospam.com (paul)", and the
MotherBoard buffered this to Video RAM:

:+]We are fixin to make a trip in the wifes car, so before mounting my
:+]new uniden 510xl in my truck, I got a cigarette plug adapter from
:+]radio shack and a wilson 1000 magnetic antenna and just kinda
:+]temporarily hooked everything up in the car. I notice that if there
:+]is no real signal coming in and the squel is down, I get engine noise
:+]out my radio. Is this normal or is it because I am pulling power from
:+]the cigarette lighter ? I've heard that if you pull the power from
:+]the same line as the car sterio, you get some noise filtering...is
:+]that true ? Thanks. (had it on coming into work this morning, so
:+]far it seems like a pretty good little radio).
:+]
:+]-Paul

The setup is ok, if all you want is something not intrusive. A better
idea would be to get rid of the cigarette lighter and use a direct
wire hookup, one side [black] to a bolt that mounts to metal thats
grounded, and the other [red] to a fuse on the panel, or a power tap.

The cigarette lighter, although convenient, is not always the best for
getting rid of or keeping the noise down. You can lose listening range
because of people you're talking to get buried in the noise.

If all you're trying to do, is check out CB radio and see if it's for
you, then no changes are needed. If you get more serious into it, you
might want to think about a serious upgrade to a better radio that
comes with a lot of features for noise reduction/blanking.

Costs more, but you'll enjoy it more too.

Try this setup and see how it works out. You did good, especially with
the antenna, you can upgrade the radio without having to get a better
antenna.

Regards!

James is right on target. Another thing to consider is connections. You can get a lot of resistance in poor connections. Poor connections means milliohms. This will look like zero on a regular ohmmeter. I have seen a 1 volt drop from the battery post to the connector on what looked like a very good connection. put your voltmeter across connections and look for voltage drops while the circuit is under load.

Correct for the first part.

> The readings from simple SWR meters will be different when you vary the place
> you perform the measurements - due to the current and voltage nodes that exist
> on the coax.

Not true. SWR meters use a directional coupler to isolate forward power from reverse power. There are no current and voltage nodes in the forward (or reverse) power when viewed independently. The nodes are created by the interaction of the forward and reverse power. Since the SWR meter separates the two, it is insensitive to any current or voltage nodes.

The SWR is not different; it is the same all along the coax (disregarding
minor coax losses). No multiple is 1/2 wavelength coax is required.
Listen to tnom@muck.net. Stop farting with coax length.

Why wouldn't that also be a problem when measuring SWR at the
antenna end? What makes the reading at that end any better?

Just put the SWR meter at your radio. For most applications,
it tells you everything you need to know (and it's very
convenient, too).

The SWR is constant along the feedline (disregarding minor losses). This is
true regardless of the antenna impedance. The impedance along the feedline
does change but the SWR is constant.

SWR is a function of reverse power versus forward power. Standing waves are
created by the interaction of these two waves. If the SWR is varying, one
(or both) of these two waves must be varying.
(Except for minor losses) how could forward power vary?
Where did the power go (or come from)?
The Law of the Conservation of Energy says it went (or came from) somewhere.

The reality is that the forward and reverse waves are constant along the line.
They have to be. Thus, the SWR is constant along the line.

Hello, all;
Will my MaCo Y-Quad cover the frequencies my Cobra 148 covers?
It goes from 26.045 to 28.055. How low an swr can I possibly hope to
attain at the edges of that spread? Should I just tune the antenna for
the cb band and take what I can get for the fringe? How would a tuner
affect my power output to the antenna? Any intelligent responses will
be greatly appreciated. Pat in AZ.

I have run into the same problem myself and I would suspect the PLL
chip. Since you have already replaced it I would then suspect the
channel selector. Internally there are several wipers that connect to
different pads that in turn program the PLL chip to give the channels.
These wipers and pads can fail as they are mechanical in nature.
I would suggest that the problem could be this. Second it could be a
voltage problem.

to talk so much trash you sure dont know much. you can buy radios with built
in linears. the lincoln is the same as the hr2510 which is used by many hams.
what class ham are you? i would think anybody on hf would know about these

already since theyve been around since the early 90's and were also put out as the radio shack htx-100. the radio is very good and high qaulity, not like the other 10 meter/ cb radios on the market. yes its a shame all the hams these days use cb's like kenwoods and yeasus and icoms. they are cb's right? since you think anything that can be modified for 11 really easy qualifies as a cb i'm sure you agree that the full coverage hf rigs are just cb's made to look like ham radios

1465. Cobra 2000 With Silver Eagle D-104 For Sale

If I had to guess, I would say that your amplifier(s) because they are
only 40Watts, are what's known as Class C output and you are, believe it
or not, overdriving them. I have no idea what "swinging to 10watts"
means, that sounds like bullshit CBer talk. You might find this hard to
believe, but once you get over 100% modulation, your signal actually
goes down. If your amplifier has one transistor, it's class C. If you
want to run an amplifier, I would get yourself a push-pull unit and
drive it very conservatively. Mine works beautifully with 4W AM and 12W
SSB. Check local laws, of course....8-)

>I began operating. I have never, in the past 22 years seen the need for me
to
>run illegal equipment.

Yes, you are most fortunate, we in the UK had to fight for our "legal " CB
and therefore any equipment prior to this was illegal. If we didnt then
legal CB for us wouldnt exist.

When looking at radios to buy, if I see that they've
>been modified I walk away. I am not interested in "soiled goods."

Some "soiled goods" have been very carefully adapted although i will go with
you in the fact that many have been "bodged". I also find that far more
interference and "busts" have occured in the UK due to illegal Amateur
operators but joe public always seems to put the blame at the door of CB.

Whenever their telly jitters or goes fuzzy " oh its that bloody CB er again", even though in a lot of cases its adverse weather conditions or someone with a knackered power tool nearby.....

> My ham equipment is the same way, unmodified, and operating according
>to original manufacturers design specifications for output power, spurious
>emmissions and the whole nine yards. That kind of operating is called
>"courteous" folks. That concept is something that most of the CB operators

From: AB7RS <tglenn@imt.net>
Message-ID: <37B1D87F.5B7E@imt.net>
Source record: 1472

Both of these are poor choices,the glass mount antenna is too small to be efficient but to big to stay on the glass for long.These work OK on UHF and microwave bands.
The CB/AM/FM gizmos work VERY poorly,sure your mobile antenna picks up o mega kilowatt signal from a gigantic antenna but 12 watts(or a thousand)from your buddies little CB antenna...get the picture.

Go to San Diego county and break for One-Eyed-Jack. He needs new teeth (Methamphetamines took care of the original ones) and a new radio since I threw his old one off the side of a mountain along with all of his other CB equipment I could find in his campsite/home!!!
He does not have a wife....would beating his girlfriend count? He no longer drives a truck because he rolled it.
He used to have a Ford Condo (pick-up with a camper shell) but that got impounded for lack of registration.
He lives on a hill in Escondido somewhere. He just had a birthday and is now over 40!!

Tell him Shadow sent ya!!

Dear Mr Thunder,
Theres nothing to know.....its common sense...and like I say for you to ask the question is admitting your a bit silly in the first place....

Let me explain, Everyone knows a bleep is louder than modulation therefore in skip conditions with QRM sometimes its not obvious when the other station has cleared. In these cases you will hear the bleep (especially if its distinctive) and know hes/shes finished talking. Also if you loose him/her in the skip you may recognise them on a different frequency so be able to try and finish your QSO.

There you go ,simple isn't it. Now please stop using HTML and reply in a form that all can read.

>convenient, too).

George: You missed the point completely!!! There are certain antenna types that are especially bad about causing RF on the feedline. With RF on the outside of the coax, moving the meter closer or farther away from the antenna will change the SWR readings. When you are measuring at the antenna, nothing like this happens. So why not measure at the transmitter end? Most of the time I do. But it's certainly not very convenient when you're on a tower to adjust the gamma match. If the antenna is adjusted for a reasonable SWR reading, and there is no RF on the feedline, then length of the coax will not cause meter readings to vary significantly anywhere along that length. But then, from your other posts, you knew that, eh???

Anybody know what the average distance a signal should reach using legal equipment? (4-5W)
Base station?
Mobil?
I understand the antenna setup and atmosphere has a lot to do with it, just looking for a range.

My legal base (using I-Max 2000) has gone as far as 18 miles and my legal mobil (using K40) has reached 4-5.

Is this good or bad?

Thanks for your responses.

Apparently this is your theory, not mine. But Ive come to the conclusion
that you like to criticize what you feel to be "improper". You remind me of
a prison guard or a gung-ho cop that classifies people in prison, jail or
being stop for a violation or suspicion questioning as being a lower class
of people. we are all human bleed the same blood. and just because you feel
your way is the right way doesn't always stand true with everybody. I be
willing to bet that you have more enemies than you do friends, If you would
apply this much effort into something more useful you would probably amaze
your own self of how much you could probably get done. But you are only
wasting time here trying to convince people here that you in some way better
than the people on this NG. If you are trying to make better operators out
of these people I think you are only causing them to be rebellious if your
causing them any thing at all. Just seams very immature to me, you should
try to be more friendly, or pretend your talking to these people in person,
face to face.

I think what the bottom line of this whole thing is don't do anything stupid from your base and you won't have to worry.

Get on good terms with your neighbors so if you start interfering, they'll tell you before they do anything (although I guarentee that 95% of the general public doesn't know who to call about CB interference in their house).

Otherwise, keep your illegal stuff to the mobile so you don't have to worry about bothering your neighbors, and don't go playing music or making noise on ANY band.

Andy,

Depends how *new* you are to CB radios. Russ, try to be specific as to which Connex radio you are inquiring. Like the 3300, 4800, 4800DX, etc...

The 3300 is much like the Galaxy 33, 44, 55, 66, 73, 77, etc.

A swing kit for this particular radio is *very* simple. The mod itself consists of a 1N914 diode and a 50 ohm resister in series. And an addition of a .01pF disk capacitor. Im sure you should be able to find this mod somewhere on the net. I am in the process of putting a web page up, though, I know that doesn't help much now. But, when it is up, I will be sure to post the URL here for any future questions you own anyone else may have. Im not the best artist, and am finding it a little more than difficult to draw the circuit side of the boards. Plus, I am continuously asking people whose radio I have modified (to borrow) so I can draw these scetches (chicken scratch). Anyway, email me and we can see if we can do it over email.

Hank

Hey. If this isn't a pinch. I lent out my PLL truth chart (which has corresponding CB models/brands), though I have another one that just goes by PLL if you know the PLL. To be honest, since the PLL is not a direct modifiable PLL, I never had a desire to "remember" the PLL model. If you can, (in case you dont already know) look at the PLL IC right around the channel selector and let me know the model number on it. Just to be safe in case you may not know exactly what you are looking at, reply to me with all the info on the IC. Line for line...

Hank

Big time ERR! I just realized he did post the model/brand. Oops. I am looking at my pll truth chart now. Damn, my mistake.

Q2045, try to post a little more info. Im assuming you have a frequency counter to let you know that channel 1 is 40 and 2 &3 are 2, etc. This might be enough to go by... I'll reply in a couple minutes... I f**ked up and didn't see the model/brand right off the bat.

well speaking from firsthand experience, being my first antenna 3 years ago was a am/fm/cb 14.00 buck cheapie, it transmitted about 7 miles on a clear day and heard about the same. but that was back when there wasnt 9 s units of skip at any given time of the day, so you might have to get a better antenna just to get out where anyone can hear you. poor choice for transmitting/reception, probably so. i talked on it with a midland radio for about 8 months before getting a base station, and it didnt burn up my radio until i found out what a SWR was (being i was only 14 at the time, now 19), and I thought that the lower the rf meter on the radio said, the better the SWR was, and i blew the finals out on my own. but the antenna was not at fault, so i would have to say that paticular antenna didnt blow it up, not to say they wont, because i only had one of them. I agree that the cell phone lookalikes are trash.. freind of mine that lived a mile from me had one and he might could be heard 2 miles away on a clear day.

hope this helps somewhat

Someone just gave me a Formac 700 Radio and a Texas Star DX250 Amp with it. I'm looking for info ref the radio and it's capabilities. I figure the Amp is 250 Watts. I'm also looking for value, since I'm not sure if I am going to keep both items or not. I have not tested them yet, but as far as I know, everything works.

Thanks in advance for any info.

I would say it is on the low side, but you haven't given alot of info to go on. For the base, the higher the better. Make sure both antennas are tuned for lowest swr.

>Thanks for your responses.

do not use a baseload mobil antenna git a center loaded antenna.
a base loaded antenna with a 3 to 4 foot whip is about 4 to 8%
efficient as compard to a dipole a center loaded antenna two foot
magmout will be about 25 to 30% efficient as compard to a dipole.
people say base loaded antennas are quieter that is becuse thay can
not hear any thing to begen with,

for the base station use a 1/2wave dipole or a 1/4wave groundplan
on a 20 to 30 foot tower feed by RG 8U do not use RG 58 on any thing
over 10 to 20 feet. the loss will be execessive and will hamper
reception and transmiting

if the total loss is say 10 db with coax and other losses
it don't make a difrence if you are runing 4 watts or 5000 watts the
transmited signal will be atenuaten by 10 db or 1/10 of the watts will
git to the antenna and 1/10 of the receved signal will git to the
radio

with all that in place a base station will git about 20 to 25 miles.
a moble will git obout 10 to 20 dipending on location.
asuming both basses and mobles are setup properly with
completly legal radios

ex the spelling

Like any other electronic equipment on a boat, I think I would want to mount it up under the steering area where it wouldn't get any direct water. Don't know of ANY radio that is going to be water proof, so you might consider fabricating a plexiglas enclosure or at least a cover. The other question you failed to ask is about the antenna. You will need something which can work without a seperate ground plane. The radio otherwise won't like the fiberglas body of the boat.

Cut your feedline using this formula:

492
------ x VF = l in feet
f in mhz.

Odd or Even, it doesn't matter!
Keep patchcord between meter and txcvr.
16" or less in length! Everyone knows
that the true feedpoint impedance of the antenna
is repeated down the feedline at electrical
halfwave intervals, so measure from one
of these spots! All parameters are the
same: feedpoint resistance/input impedance,
inductive or capacitive reactances, etc!
For real antenna fine tuning, look into
a piece of equipment known as a noise
bridge, this device is used to measure
feedpoint resistance as well reactance!

RJ,
Please look around and fin an antenna that you like, there are many shapes and sizes. Please don't waste your money on a window or am/fm/cb conversion. I guess what I tell my friends is : " Lets go antenna shopping and if we don't find one that supposibly looks cool than I guess that CB isn't for you."
I just don't understand, is cb like riding a moped to some people ? They are fun until someone notices .
If you want to see some big antennas go to a hamfest ! and some autos will have 7-8 antenna on them.
Moral of the story: I hate to see you waste your hard earned money and also you need to find out if CB is really for you.

My 2 Cents,
Tinker

BTW: Do all you CBers remember drilling that first hole in the roof ? I bet we all do. GULP !

Two Parallel elements spaced 1/4wave apart and fed equal currents 90 deg out of phase will have a directional pattern in the plane at right angles to the plane of the array. Ther maximum radiation is in the direction of the element in which the current lags . In the opposite direction the fields from the 2 elements tend to cancel.

this means in laymans terms 2- 1/4 wave antennas spaced approx 9' apart and fed equal currents, if we feed the back antenna with 6' and the front antenna with 12' into a tee, etc. this means the front antenna is being fed 90 degrees out of phase and since the coax is longer to the front antenna that means the current would be lagging the front antenna, and maximum radiation takes place in the direction of the lagging element. Which mean this would be the front antenna. Maybe thats why your not doing so good your backing up to the line.

Pat in AZ.

Really Pat, swr is the least of your problems!
And I just know that we won't find you above 28.0,
notwithstanding however the possibility of your
posessing the proper license! With a directional
antenna I would think that pattern reversal is
something that you should want to consider. In
a 2 element array (driven element, reflector element)
as transmitter frequency drops the reflector changes
into a director element. As transmitter frequency
goes up, interaction between the elements drops of
to a point where the reflector is no longer part of
the "system. At the onset this results in lowered
gain, as well as the antennas inability to reject
signals from the sides and the rear. This pretty
much establishes the upper limit of the array. The
lower end as characterized earlier, will be when gain
falls off noticably, as well! Now theres that thing
between 26.045 - 28.000, or about 195 10khz wide channels!
Your job now is to determine what frequency to tune
the system for to minimize these "effects"! Now if we
just throw these figures into the grinder, (calculator)
we find that an average of the 2 numbers comes out to
a frequency of 27.0225. This would be good enough
for anyone. I tune all of my arrays at exactly 27.000 mhz.
Or you can experiment for yourself! If everything goes
well, your swr probably won't rise above 1.7 or 1.8:,...

Have fun and let me know what happens,

Jack

P.S. I want to apologize in advance for running "long",
I hope this helps.

It's a Cobra 29 LTD. It's one of the most popular radios in the
free world. The reason I haven't exactly specified what his
problem is is because I'm too lazy to go to my file cabinet and
pull out my service manual for that radio. You (Hank Aaron)
are really pushing this. The problem is that you haven't
provided any real help at all. You're tooting your own horn
like you're an expert, but all you post are excuses for you
own ineptitude.

Even if it wasn't your question, you didn't provide a reasonable
answer.

What's more important is that you don't know who you're dealing
with. I'm not just some fuck who has a CB website. Your
little stabs at me only prove that you don't know me. I'm not
the asshole in this situation--you are. All I'm trying to do is
help people. All you're doing is trying to feed your ego by
lashing out at others.

Buckaroo 223,

First of all, forget about the receiver. The
510xl transmitter should be set up like this:

ptt carrier, or dead key: 1.5 watts
300-3000 hz single-tone pep: 15 watts plus

if you can get the transmitter to work
as designated above, everything will be
just fine!

Jack

You can try to explain it, but you can't prove
anything due to the fact that we're debating
the point over the Internet. In this forum
all there is is your typing and my typing--
neither "proves" anything.

> I can backswing to 45% of
> what IM deadkeying and you would not be able to tell by just listening to
> your radio.

Yes I would. You have to keep in mind that I'm
in this business too. I've been in CB for 20
years--I have a trained ear. I can easily
detect amplifier overdrive. Any long-time CBer
can detect amplifier overdrive--especially if it's
intense like in this specific situation.

> I dont chose to argue with you, have nothing against you and
> enjoy your post But I personally Know of numerous people who swing down on
> there bird meters by 50% and still sound as good as a radio station.

Then you don't know what "good" is.

A "good sounding" AM signal is symmetrically modulated.
That means the positive-going and negative-going modulation
swings are equal and opposite. When that's the case, the
average power (as measured on a Bird) will stay the same
at any modulation percentage.

Backswing on a Bird means that your dead-key is too high
and that the quality of your modulation is suffering
because of it--it's that simple.

The original 43 isn't even accurate at measuring
carriers. That's why they came up with the "APM."
If you want proof, read the AM Tutorial on my website.

My guess is that they want to cheat and say that the dead-key
wattage is also the average (aka RMS) wattage.

That's very questionable based on the vintage of the
amp you're using to prove your point. Many people
will verify that the current crop of SS225s use 1446
transistors.

> also i rebuilt a pride 100 and put 2 mrf 412 pills

My Motorola RF Device Data Book doesn't list the 412.
You'll have to clue me in on what it is. My guess
is that you used the MRF421 which is a powerful but
very low gain device. At very high drive levels the
421 will outperform the 455. The 421 is also much
less susceptible to being overdriven--that's why I'm
thinking that you used that transistor. The problem
with the 421 is that it has very low gain. In other
words, a typical CB won't drive it to anywhere near
full power. Given that, the 455 will outperform it
since the 455 is a high-gain, low drive device.

Based on what you wrote, there's no reason for a pair
of devices that total 95 PEP watts to outperform a
pair of devices that conservatively put out 120 PEP
watts. I've seen a pair of 455s put out 210 peak
watts with 40 watts in and a DC supply voltage of 14.
I've tested 421s under the same conditions and all
they want to do is draw huge amounts of DC current.
The bottom line is that the 421 is a pig. They draw
a ton of power, make a ton of heat, and don't live up
to their billing as far as output power is concerned.
Think about it--if the 421 was so hot why are we all
using 2879s in the most demanding applications?

> they said that it was not nearly as muffled, etc. and as far as
> my meter being innacurate, its a DOSY 4002, go figure.

Dosy meters are always generous--that's how I figure.

I've seen my share of Pride 100s too. I know their
limitations. They ran the collector current through
the on/off switch, they had small output transformers,
they had long, thin DC supply and RF traces. In other
words, they were far from being high-performance amps.
I'd take a Blue Face 225 to a Pride 100 (they are
supposed to be equivalent amps) any day. I'd also
put a substantial amount of money ($1000) down that says
a Blue Face 225 will take out a Pride 100 in a keydown
event when all other variables are equal. I know both
amps that well. A pair of 421s will sound cleaner than
a pair of 455s if the 455s are overdriven; however, the
421s won't necessarily be producing more power. If we
limit the input power to 18 peak watts (a tuned up 148)
the 225 will kill the 100.

> cant always afford
> bird

There are other cheaper, reasonably accurate meters.
Try a Mirage MP-1 or a Bulldog. Just make sure to
use an accurate (50 ohms cold) dummy-load.

It's reasonably accurate on AM too. It's just an
average power meter. In other words, the positive
and negative modulation peaks cancel each other out.
Ideally, that leaves the carrier. In other words,
in a perfect AM signal, the reading will not change
with modulation since the modulation peaks are
equal and opposite. Given that, the AM reading
will be the same as the FM reading since modulation
will not effect the reading. On SSB you can see
the PEP power without a peak-reading kit by simply
injecting a pure audio tone into the mic jack and
letting it produce a single frequency output signal.
The single frequency output signal will look like
a carrier to the meter and will be measured as such.

If all of this is confusing, read the AM Tutorial
on my website. There's a link to it below.

My guess is that you're overdriving the amp. Using any of the
radios you mention will result in the same effect. Sell the
small amp, buy a bigger amp that uses push-pull pairs of tran-
sistors, and have the radio tuned to properly drive the amp.
Not every tech knows how to tune a radio to properly drive an
amp, so you may have to go to a few techs before your set-up
works right.

1556. Re: Lincoln. A ham rig?

Newsgroup: rec.radio.cb
Date: 1999-08-11 00:00:00 UTC
From: Hank Aaron <hank_aaron@hotmail.com>
Message-ID: <7otdb4iru1@news.gate.net>
Source record: 1556

Okay. Please read this message with this thread people. R HOOLIGAN is an asshole. There really is no other word for it. Yes, it. I do not define this it as a person, since he seems to have no morals whatsoever. I figure he has a bad week at work, doesn't get sex, or drank one too many. I really cant tell you for sure. But, he DOES have a self esteem problem not to mention severe mood swings. The HR-2510 is a HAM Radio. Maybe not a Kenwood, Alinco, Yaesu, Standard, etc. Though, nevertheless it IS a HAM radio. In other words everyone (who does not know it is a HAM radio) who posts a reply message in regards to the particular original post of this particular thread is totally ill knowledge, irrational, and just an ASS!

So, there really are no "pesky legal issues." Unless your ignorance, agitation, and attempt of an intelligent sarcastic remark is illegal, then there really are no issues. Are there?

You CONTINUOUSLY attempt to create havoc, in more than some cases succeed. However, the unfortunate truth of the matter is, you use such words that may make most use their thesaurus while all along mentioning nothing more that irrelevance within context.

So. Please Joe, I would like you to prove me wrong at this point if you can, so that I may apologize. I dont wish to make enemies, especially with people as sweet as yourself. Please who me an URL that a NON-modified HR-2510 is not a HAM radio. In fact, it is the modification of this radio that allows it to operate on the CB band.

So. This person who originally asked whether or not a Lincoln (2510, 2600 equivalent) could be modified to cover a more broad range of HAM frequencies mentioned nothing of modifying it for the CB band. To break it down big bird style so that you and others will understand:

He asked (big bird style):

"How can I get a 10 meter radio to operate on the 20 meter band?"

There, now do you understand how much of an idiot you sound?

Yes Joe, I did call you a name. The only mature advice I can lend you is, get over it.

Hank (yes, the fake hank, with the fake jeff herrings hotmail account)

Bill I choose to modulate forward, as it easier on my equipment and with the voltage I like to run, its a whole lot cheaper. I was simply posting what I have seen to be true in my case. There are alot of dudes who also talk on the bowl with a very large carrier that back up on their 43's and are very clear and clean sounding. I myself Have caught myself twisting my variable key to extremes from time to time. as I personally believe this helps when some body rolls a nasty 5 on you and you need a little extra punch. I dont post fake names, as a matter of fact I have posted a couple of times under my real name. My real handle is Peak-a-boo and if you listen to the bowl when the bighorn is in your ears you will hear how clear a large carrier can sound. Especially if IM getting My brains beat out half the time in DX.

PEACE,
BOO GONE!!

Actually.. He is in error. Since his ignorance leads him to believe that the Lincoln requires a "mod" to "transmit" on the 10 meter, when instead it IS a 10 meter rig by nature, anything he would mention within this thread concerning this particular radio is irrelevant (not to mention plain foolish).

Hank

Is this another example of a no brainer ham radio operator? The positive and negative peaks are 180 degrees out of phase and cannot cancel. Not to mention the fact that cancellation is not posible with a single waveform. It takes two waves in opposite phase to cancel and two waves with opposite phase, equal amplitudes and waveshapes to cancel perfectly. A signal from a transmitter is one wave and has nothing to cancel with, so where do you get the "positive and negative peaks cancel crap"? Need I mention again that the positive peak is 180 degrees from the negative peak? And that cancellation occurs with two waves where the positive peak from one wave superimposes with the negative peak OF THE OTHER WAVE! By the way Mr Brainless Bill who feeds misleading tripe to the masses out there, it takes two hammers to screw in a light bulb.
Russell Clift AB7IF.
Now I can see why Jack was so confused, because YOU DON'T KNOW JACK.

Bill,

See, that's what I thought! If we look at
a typical pattern, beginning at zero, this
would be 0 degrees....as we follow the sine wave
curve to the crest of the positive peak, this
would be 90 degrees....back down to the 0 line
would be 180 degrees....down to the crest of the
negative peak would be 270 degrees and back up to
the 0 line is 360 degrees makes one full cycle.

Look at the figures at the positive and negative
crests....90 degrees and 270 degrees....let me see,
270 - 90 = 180....I believe that is correct. The
positive and negative peaks are 180 degrees out of
phase, occuring at two different instances in time,
so how are they able to cancel each other out?

Now I am no longer confused!

Jack

The channel selector is a good idea but the most likely failure is the ribbon cable to the motherboard. I suggest you check each wire first. AB7IF.

I might add that binary coded decimal is what is used here and from the symptom the odd or 1 bit is missing, so that narrows it down to only one wire to the pll chip. Or one contact in the channel selector itself. I do not think it is the resistor array but worth looking at. AB7IF

Chris,

Quit whistling into the mic!....
"Just Kidding".................
Try reducing the ptt carrier or
dead key of the radio that you are
using to drive the amp with. You
really don't provide enough info
for me to go into any great detail!

This should be enough!

Hope this helps,

Jack

What the hell got up your ass? Then continue to be lazy. I just think that its too bad that he cannot use his radio. I know that it is a Cobra 29 LTD jerkoff. No, you know what. Nevermind. :) I will keep you at your own lower levels. I hadn't made any sarcastic or derogatory comments towards you, so why you would make such a post to me... well.. Maybe you can enlighten us all.

********** Clipped reply to Bill's message **********

"It may be faster just to retac all of the solder joints then to first, figure out binary, etc, etc.. That why I keep repeating for him to tell us the brand/model. Then I could narrow it done, as well as many of other people...

Hank"

****

Did THIS set you off? Well, I appologize then pal. I'm sorry for your bad day. Actually my friend, you are probably one that would place a "Swing Mod" in this radio by placing a jumper in place of the anti-spiking diode huh? Please tell me you do. But hey. I really dont know why you got so upset. "Then I could narrow it done (err down), as well as many of other people..." That included YOU Bill. As in, YOU could also "narrow it down."

God. Im done. You jumped the gun.. As far as "pushing it," Im sorry you WONT get off your lazy ass and get that service manual and help him then.... or alteast post what PLL (Phase Locked Loop) IC (Integrated Circuit) is in the Cobra 29 LTD. Oh, why dont you share with us how to directly modify the PLL in the 29 LTD (not SSB radios)for extra channels? I have a feeling you are going to tell us you cannot. Well then, why the hell would I remember what PLL is in it? Just as you did not make any effort to remember it either...as made abundantly clear when you told us you had to look in your "service manual." See I lent out my SAMS Photofact 56, 217 and Lou Franklin's CB PLL Data Book, but you have yours..

I believe it is the uPD2816 (which utilizes a 6 bit BCD/ROM programming), but as I said, I cannot remember.

"Hank Aaron"
MCP+I, MCSE, CCNP, All around CB tinkerer

Oh, Bill, there IS more below. Take care.

PS - To the rest I apologize. I just saw this as totally inappropriate.

IN REPLY

Performance wise (transmitting and receiving), all 102" whips are the same.
Construction wise, the quality and durability will vary from one brand to
another.

>output power?

Partly. And because the design of the CB service is such that transmissions are contained on "channels". CB is exempt, just as business band, aircraft, and marine radios are exempt. One also does not need Morse code for the ITU channels between 3 and 30 MHz.

1598. Some help to the semi-newbies (was Re: Shooting Star 225)

Newsgroup: rec.radio.cb
Date: 1999-08-12 00:00:00 UTC
From: warlok671@aol.com
Message-ID: <19990811235642.13910.00000170@ng-ce1.aol.com>
Source record: 1598

Some of you folks new to this board should understand some things.
There was a time when there were many intellligent people posting good technical answers helping all of us in the CB hobby.
Because of the influx over the recent months (moreso than in the past) of instigators, we have lost most of these people. There is less than a handful left, Bill Eitner being one.
Although Bill can become colorful asnd brash sometimes, he is usually very helpful, especially to the "newbies".
As to the original poster of this thread:
Your meter is not neand more than likely is not accurate. Typically an amp with (2) MRF devices (such as 455/454) should have no more than a 2w carrier input. Let's use some hypotheotical <sp> situations. I typically see about 25w PEP on a tuned Uniden76, 30-35 on a single final Galaxy (55,66,44,33). With these inputs to (2) MRF 455's I usually see 190-220w PEP. This is with a 2w carrier input, and in high power mode about 70-100w carrier out of the amp. These figures are relative, as I do not own a powered peak reading meter, but this suits the purpose. I would suggest taking your meter to a shop that can calibrate your high power scale's peak readings to that of a Bird 43P.
As to the fellow that mentioned wattage reading swinging bacwards 50% and sounding clear, I'd tend to think that was wattage readings from a Bird 43 or some other form of RMS meter. It is most common to have an amp (for example) with carrier of 70w and PEP of 250 show backwards wattage on an RMS meter. What Bill is referring to is the rule of thumb for AM operation is to have 25-35% carrier to peak ratios to have strong clear sounding station.
Finally to the newbies: the Radio Shack meters are only good for reading SWR and carrier levels. They DO NOT read peak wattage, closer actually to RMS.
Hope this helps some of you, and dis-arms others.
Good day mates.

Wm.

> Same
> >thing.
My guess would be a bad or broken contact in the channel
selector,(broken connection where it solders to the boardor broken
ribbon cable between selector and board,wichever applies to this
model)or a broken foil path between the selector and the pll
chip,especially if someone tried to modify it for channels and didn't
have good soldering skills.

Why are all you reg. newsgroup user's letting the so called big shot
ham boy's push you around ?
All they are is regular guy's just like you and i but there
is only one difference , they all have no PENIS!!!!!!!!!
Why do you think they are all here and not on there own newsgroup?
it's because they were told to leave or their wife's kicked them out
of the bed because they stayed up all night picking on cb"ers.
and some of them lost their job's because they were so ingrossed
at picking on the cb'er. it took up to much of their time from the
job.
now do you all see my point?
just remember this one line and you will no longer be scared about
talking about what ever you want to on this newsgroup and that is,
some of these's ham boys have no PENIS!!!!!!!! and they no who they
are.
AND REMEMBER THIS, IT IS NOT UNLAWFULL TO TALK ABOUT
AMPLIFIERS ONLY TO USE THEM!!!!!!!!!!! POINT SAID
So you all have a good night and a good day , and im clear on this
channel 19

An Antenna Specialist brand 102" whip seems to not take a set when bent as bad as the radio shack brand. In other words it can take a beating without staying bent afterwards. The steel must be tempered harder. They do cost a little more as well. The stud on the end seems to be stronger and built better than radio shacks as well but they do both match in and play the same.

: >I would not count on more than about 0.5 MHz at a VSWR under 2:1.
: >--
: >Bill Nelson (billn@peak.org)
:
: Depends on what you mean by bandwidth. Typically this means Freq vs SWR. It
: could also mean FREQ vs gain or FREQ vs FB ratio. Typically the freq vs gain
: bandwidth for a yagi is about twice as wide as the freq vs swr. This being the
: case you could use a tuner with your setup and easily cover 1Mhz with good
: performance of the system.

Bandwidth is usually stated as frequency vs VSWR.

If you use a tuner - the bandwidth of the antenna does not change. All that happens is that the tuner allows you to use the antenna far outside what would be considered its "bandwidth" (by any reasonable definition).

For example, I could use a 10 meter antenna on 80 meters, if I used the proper tuner. There is no way that the antenna would even be close to resonance and the radiation efficiency would stink - but it would work.

Everyone, why yes. Be careful! According to Bill (I feel this is a safe analogy) we should all use our real names, just as we should broadcast our home address on the CB. Wake up Bill! So, if I dont announce my home address on the CB I have no credibility? Noooo.. That just means I dont wish for crazy fucks like yourself showing up at my doorstep. It saves me the trouble of pulling either my Glock or Ruger 9mm on them.

Hank

PS - If others feel that it is absolutely safe to announce your home address on the CB, then follow Bill's wisdom of using your real name on the newsgroups. Take care.

Yeah, and tried to cram other amendments down our throats that are
contrary to the Constitution - regarding religion, flag burning (freedom
of expression), pornography (censorship) etc.

Regardless of how you and I feel about such laws - BOTH major parties
are not interested in the people - only getting their agendas passed.

: Such an amendment would protect for all time the bill of rights and =
: other sections of the constitution that are constantly falling under =
: attack by liberals. Every time this amendment has come up liberals have =
: philabustered, attached unacceptable riders, and engaged in other low =
: tactics to prevent the amendment from passing.

As have the Republicans for bills proposed by the Democrats. BOTH parties
are just as guilty as the other.

: Clinton has signed more executive orders than any other president in the =
: history of this country. He repeatedly circumvents the will of the =
: people with these executive orders by using them to make laws that he =
: either failed to get congress to sign off on or knows up front that =
: congress will never pass.

Executive orders do not become law. They are just orders that exists as
long as they are not recinded - which can be done at any time by the president
in office - or by court review.

Clinton could never become a dictator - the military does not like him
well enough.

:
: The meter is inaccurate, and it's best if you make
: wattage measurements using a dummy load rather than
: an antenna. Any SWR (reflected power) at all tends
: to skew wattage readings. Your test set-up is
: showing the dead-key too high and the peak too low.

Maybe he is reading dead key and swing both on the RMS scale. If so,
then the readings are not that bad - although there would be too much
modulation. On an averaging scale, the meter reading should only
slightly increase with 100% modulation.

The reason you measure at the antenna is because only at the feedpoint is the impedance correct. Remember a meter must obey ohms law even if a lot of other people do not. Also, at every 1/2 wave length away from the feed point as well. so pick a channel where you do your measurements and make the coax length come out right at the meter at the radio end. If there were no standing waves on the coax the impedance would be the same everywhere down the coax. In the real world this does not happen so try the multiple of 1/2 waves idea and do your readings at the minimum power level to calibrate the meter if you want to get the best readings.
With standing waves there is a range of impedances down the coax ending at the antenna impedance each 1/2 wave down the line from the antenna.

:
: Bill says:
: > the US WANTS the ITU to have as much force as is
: >possible
:
: Another BINGO. I see Mr. Nelson DOES understand the concept at work here.

Correct.

: Bottom line:
: Morse code proficiency is required for frequencies below 30 MHz because of an
: ITU regulation. Someone asked about this earlier in the thread, and that is
: still the answer. Mr. Nelson can play "lawyer" all he wants, but the facts
: don't change.

I was not "playing lawyer". I was simply correcting a false statement. The
ITU regulations are just that - regulations that are followed by the signatory
nations. If they were international laws, then every country would have to
follow them - which is obviously NOT the case.

For the reasons I stated, the US is not going to leave the ITU.

Yes, I use that very same antenna. It is a large coil type, Light weight and very broadbanded. It advetises that it will withstand up to 15,000 watts. I don't possess that many watts to see if that is true. Nevetheless, it is a very nice antenna. You may want to look at the Galaxy 25K, or, the Thunderbolt 20K. There's even an Antron 21K. These are like antennae if you are looking for an open coil design that's big and large. You can save yourself a few buck by making one yourself. All of the parts can be had at your local hardware store. Use copper. The most difficult thing is getting a coil turned. To do it properly you will need a lathe. Good Luck

Well, my Maco V-quad had a range of about a Mhz of good swr.
To me good was 1.5 to 1 or under.
Figure out where you'll be operating, and tune it for the middle of
that range.
To be honest, most freebanders are AM'ers, or SSB'ers, but rarely
both. I know, we USE both, but I can speak for myself that I tend to
hand above the 40, on SSB.
If you find that you've gotta have full run of this range, (don't go
about 27.999) Get yourself a tuner. I won't help for performance
much, but will keep you from destroying the radio.

Okay, I'll disagree.
If you're LISTENING to your contact, and allowing the amount of time between keys for another station to jump in, then you CAN tell when that party has stopped talking.
Roger beeps are annoying. Being out here in the country, I constantly work stations that are in my static level.....radio cranked up, headphones on.....and then BEEP. Not useful.
I know when I here a person using one, and it'a a matter of making a contact with them or not, I choose not.

Since when do you whistle during a normal converstation?
Does this happen during voice comms? If not, then it's not a worry.
Chances are when you whistle, you're shutting down the ALC (or
activating?) in your radio, which cuts back your radios power, thereby
cutting back the amps output too.

Hello Myway625: A effective but inexpensive CB antenna can be a 102 inch Fiberglass Whip Antenna mounted in the center of the Bow area. This antenna will require 3 or 4 ground wires connected to the shield of the coax, and routed away from the antenna, with a length of 102 inches. Its ok if the ground wires are bent, and then routed down when they run into the side of the boat. The ground wires are mounted just under the Bow's fiberglass, which is transparent to the RF energy. This is how a lot of Marine antennas for the CB band are installed.

Or the use of a Shakespeare ABS1600 or 176 would do nicely mounted to the side of the bridge, with a 10 foot extension, maybe. Look at the Shakespeare web site at: http://www.shakespeare-ef.com/

As far as the radio goes, I thought that there was a CB radio made by Midland that was water resistant. Good call on wanting a water resistant radio. I've seen a lot of boats with radios eaten up radios. I have always thought that a radio could be made moisture resistant by spraying a sealer of some sort into the radios chassie, but have never tried it. Good luck.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

Myway625 wrote:

tune the amp for max. forward modulation "swing" WHILE saying
"auu" as in "audio" or whistle (cheap meters show more this way)
instead of adjusting your amp for max. during deadkey.

where's dennis, sean and the others ;-<

Actually it is a treaty agreement. The ITU predates the UN and is not related to it directly. It is in the best interest of the US and other large countries to remain a signatory to the treaties--it keeps everyone on the same page.

The problem with spell checks is that one doesn't have them when they are out in the real world communicating verbally. However grammatically eloquent someone may appear to be as a result of a posting used with some sort of grammar or spell check, sometimes a false impression can be delivered as a result of these devices.

This is the reason I prefer not using such software. 1. It lets one *really* understand the demeanor of the respondent and; 2. It allows a person to understand the grammatical ability of the person to whom a response is intended. This is just as important "in writing" as it is "in person". Ive met Keyboard Rambo's that when debated in a face to face manner, they've melted like a stick of butter on a Texas highway in July.

Call me old fashioned, but Id rather receive a handwritten letter containing dangling participles and excessive gerunds than some letter manufactured with the assistance of Mr. Gates and his ASCII warriors.

>I alleviate this problem and get more forward swing?

First off check you deadkey on your radio.
How high is that? The common mistake in setting up an amplifier is to try and get the
last watt out of it. A swinging amp will out talk the same amp that has a high dead key and litttle or no swing. I try to feed an amp 2 watts or less dead key no matter if it is "high drive" or not. I personally set amps and radios to swing forward in all settings even it it means a 1/2 watt dead key into the amp.

Hola you idjit!

Not only are you an idjit, you are a liar. Such was not the procedures
in 1963 when your novice exam was by a volunteer and other exams were by
FCC examination which was not open on a weekend day. And at that time
it was necessary for a 12 month delay in waiting to take Extra exam.

Your whole story is a lie in 1963.

Gracias!

But putting 10 on 80 is not what we are talking about. We are talking about pushing a normal 11 meter beam into the freeband area. The first thing that goes is the FB ratio but there is still considerable forward gain. The SWR

never even gets to 3:1. AS long as you are running good quality coax this will never be a problem. For those of you that have MR4,s or similar antennas try it. Forwardd gain will be about 3db down from what the antenna was designed for and FB will be non existent but we are still talking about an antenna with 6dbi of gain left in it at 27.70 and 26.70. I would hardly call this stinking. If you want to broad band the MR4 even more you can move the firsr director closer to the driven element. About half the distance it is now from the driven. This will broaden it even more but you give up gain in the middle to do this but probably will not need a tuner. If you spend most of you time in FB land this may be the best way to go. Ther are no free lunches when it comes to bandwidth. You have to give up something for it.

two
>meters and your sure to get a laugh.

It's really to bad that CBer's can't understand why they get so much
negative attention, and not just from the Ham Radio group either.

Many CBer's run illegally modified radios, illegal external power
amplifiers, violate antenna height restrictions, freeband, exceed maximum
legal contact distances, cuss on the air, play music, jam other CBer's,
interfere with other broadcast services etc. Most of those who do one or
more of the after mentioned items know exactly what the Part 95 rules are,
and very deliberately break or ignore them. Yes, I know some of that does
occur on the Ham bands too, however it is a VERY TINY PROBLEM compared to
what goes on on the 11 meter CB band! I know, I was a CBer myself 20 years
ago and was so disgusted with the mess at that time I got out of it.

Now if the illegal activities of CBer's only affected other CBer's Ham's
would care less. However that is not the case. Because of the illegal use of
external power amplifiers by CBer's, Ham's can't buy power amplifiers (which
per Part 97 rules we have a right to use) that work on our 10 meter band. We
also find CBer's at the bottom end of our 10 meter band now too, illegaly
interfering with Ham Radio communcations.

CBer's who very deliberately break or ignore the Part 95 rules are digging a
deep pit for all CBer's. Right now there has been a bill introduced in
Wisconsin (Feingold Bill) designed to allow local law enforcement to bust
illegal CBer's. Now a similar bill has been introduced here in Michigan (by
Congressman Veron Ehlers) also designed after the Wisconsin bill. People are
fed up with the mess that the 11 meter band has turned in to and CBer's have
nobody to blame but themselves. As more bills (like the Feingold and Ehlers)
catch on in other states, the illegal CBer will find that he now has more to
worry about from the Bears than getting a speeding ticket. And when the
bills pass they will be able to take your CB Radio and amplifier too. And if
the CBer is dumb enough to protest, they will take your butt too!

Cleaning up the 11 meter CB Radio band is long over due and it finally
appears that is changing. If nothing else, CBer's should consider the
Wisconsin/Michigan Bills as a "wake-up-call" to start doing some in-house
cleaning on your own before you are forced to jump in to the pit the illegal
CBer has dug for you all.

Yes, it's easy to tell when someone has stopped talking, but sometimes they do a "Pause for effect", like "Sure is hot here in Texas.....wish it would rain". Someone might assume that because he stopped talking, that he had unkeyed. Roger beeps help eliminate the confusion. One solution to the annoying beeps would be to use DSP, since you can set it to eliminate tones, but still pass speech. I know, I know, you shouldn't have to buy DSP to be able to listen to the radio without being annoyed. Another solution would be for SSB ops to replace the beeps with the word "over" to signal that he has unkeyed. Just for fun, I looked over the FCC rules, and don't see roger beeps listed under either permitted or prohibited communications. But I did notice that tone operated squelches are legal. I've never seen CB's with tone squelches before. That would be a great way to filter out all the noise and only receive from stations who are calling you and know what sub-tone you are using.

>Listen to tnom@muck.net. Stop farting with coax length.

George;
This is only true if the antenna is matched. A 1/2 wave
(electrical length) shows the antenna impedance at the feed point.
So if you can't insert the meter at the antenna, a 1/2 is a good
starting point to use to match the antenna with the meter inserted at
the transmitter. After you match the antenna, then the length of coax
shouldn't effect the SWR.

as an example:

A typical 1/4 whip will have a feed point impedance of around 36 ohms.
Feed that with a 1/4 of 75 ohm coax, the feed point impedance will be
around 50 ohms.

Feed the same antenna with a 1/2 of 75 ohm (or 50 ohm) coax, the feed
point impedance will be 36 ohms. The SWR is not the same all along
the coax, unless the antenna is matched. So you can match an antenna
by changing the length of coax.

From: Kevin Muenzler WB5RUE <wb5rue@stic.net>
Message-ID: <19990812.153838.wb5rue@stic.net>
Source record: 1655

With all this concern about hams on a CB newsgroup we have skipped the issue of CBers on HAM FREQUENCIES. If CBers think that they are allowed, by some mythical right or something even though LAW forbids it, on ham HF bands then why do they have such heartburn over hams on their internet newsgroup which is open to anyone?

Like I said, it must be some mythical right or something.

Kevin, WB5RUE

Liberals have rights, real and imagined. They want government to pass laws that guarantee that no one will violate any of their rights. They have no responsibilities, it is up to government to take responsibility for everything.

Libertarians have rights, real and imagined. They want government to pass no laws that would violate their right to do what they feel is right, which is up to their own individual interpretation. Responsibilities? They take responsibility for only those things that would not hinder the exercising of their rights.

Conservatives have rights, real and imagined as well as responsibilities. They want government to pass laws to remind us the difference between our rights and responsibilities. There can be no freedom without responsibilities.

1656. CB used to disable car electronics ?

Source record: 1657

This is my problem:
I have just made a baycom modem I want to use for mobile packet radio on 27Mhz (using a handheld CB). When transmitting the modem seems to completely go nuts (PTT hangs, the AFSK tones coming from the modem change randomly in frequency). It seems part of the RF energy is sent through the cables connecting portable and modem. I have enhanced the original schematics by adding LC filters (100�H/47pF) between CB and modem, but this doesn't seem to help (ferrite beads don't help either). A weird thing about the situation is that when I lay the antenna in parallel with the modem PCB everything is ok, but when I hold the portable far away, vertically the modem goes nuts again (I would expect the opposite).
I've had problems with hanging PTT in the past in combination with a static transceiver, but that was almost always because of a bad SWR.

Even if this was possible, do you really want to be responsibile for the potential deaths of the passengers? Several months ago, the question of Y2K and cars came up with a similar tone. The answer of course was that auto ignition computers were not tied to a date, but if they were, would the manufacturer risk having the car go dead in the fast lane of the freeway? Get reasonable. If some guy can transmit 20000 watts from his Suburban, fry his brain, but not harm the truck, how do you think you are going to press a button and zap the guy in front of you using a CB?

T-Rex,

Sorry you missed the original question. Buckaroo has a 510xl keying 3 watts with peaks at about 10 watts. The 4 watt drive figure that you refer to is an rms figure, the peak figure being somewhat higher than that. A stock radio would just make his problem even worse. See my last response in this thread!

Hello.

I would love to bounce ideas your way. But, I dont think I totally understand what it is you want to do. By what I can gather, you want the car to be disabled if you key your CB when using a linear? Maybe if you tell us more .... such as "I want it so that someone cannot steal my car if they key my CB"... then I myself will understand and can help to come up with a solution....?

Hank

and let's all pull together and get these morans out of here .
remember this , there is power in number's . just 1 person call not do
it all. but i was here long before the hammies were and they sure the
hell are not going to run me out of here.
have a good one people and think about it before you fly off at the
mouth, because you just might be eating your own foot..
to all you dumb ass hammies and you no who you are ,
not all ham's are bad so don't take me wrong guy's .
but this is a war you will not win. c.b radio's is here to
stay!!!!!!!!!!

1668. Re: Why are CBers on HAM frequencies? (was Why are hams in this News group ?)

Newsgroup: rec.radio.cb
Date: 1999-08-12 00:00:00 UTC
From: Hank Aaron <hank_aaron@hotmail.com>
Message-ID: <7ouvq9$1k44$1@news.gate.net>
Source record: 1668

Hello Kevin,

No. I think the majority of OUR "heartburn" is that some HAMs (I didn't categorize and say all, or did I just leave it as "CBers" such as you did) assume that all CBers operate on HAM frequencies. I personally do not feel that it is a RIGHT (of any kind) that anyone (who please to) should operate on HAM frequencies. I feel that HAM's have earned this PRIVILEGE by passing appropriate exams. But, enough with that. The only concern I have (and probably shared by many of CBers on this newsgroup) is that HAM's make this their domain for exhausting their ill feelings towards those FEW CBers that DO operate on (not theirs) the FCC's frequencies set aside for HAM's.

Take for instance Kevin, there was a recent thread concerning issues with how to modify a Uniden/President Lincoln. This radio by its PRODUCED nature is a HAM radio. One gentleman asked how to modify this HAM radio to operate on 20 meters, which happens to be a HAM frequency range. Well, many HAMs (not all now, Im still not categorizing here) assumed (out of ignorance, which there is NO excuse) that this gentleman was trying to modify a -CB- radio to operate on HAM frequencies. Well Kevin, this just was NOT the case. In with this assumption many HAMs (not all) also categorized and implied that this person was a CBer trying to access "illegal" (HAM) frequencies and that ALL CBers do such business.

I guess you could say that the heartburn of it all is, the fact that people (Im not gonna categorize and say HAMs [because not ALL HAMs share your ignorance]) such as yourself, assume that ALL CBers wish to operate on illegal bands. So, in essence, I for one am tired of seeing posts from some HAM's (such as RHOOLIGAN and yourself) that imply -I- operate on HAM frequencies.

Regards,
Hank

Kevin Muenzler WB5RUE wrote in message <19990812.153838.wb5rue@stic.net>...
>With all this concern about hams on a CB newsgroup we have skipped the issue of CBers on HAM FREQUENCIES. If CBers think that they are allowed, by some mythical right or something even though LAW forbids it, on ham HF bands then why do they have such heartburn over hams on their internet newsgroup which is open to anyone?

1671. What is the deal "QSL Cards"

Newsgroup: rec.radio.cb
Date: 1999-08-12 00:00:00 UTC
From: Joe <2nc605@usa.net>
Message-ID: <7ov4tbhgq1@nnrp1.deja.com>
Source record: 1671

What's the deal with operators asking for a
donation of one US dollar in return for a QSL
confirmation card. I enjoy DX and do not mind
exchanging cards but I refuse to pay the extra
buck. The way I see it, I'm already spending a
dollar for the card&postage. Why do some
organizations feel I should pay for their half as
well. I'm not saying that a dollar is going to
break me, with as little as I exchange these things,
but don't you agree that it should be a 50/50 arrangement?

Does anybody send the "donation"?
Am I being unreasonable?

Thanks, Joe

The Magnum wrote:

Dear Mr Thunder,
Theres nothing to know.....its common sense...and like I say for you to
ask the question is admitting your a bit silly in the first place....
Let me explain, Everyone knows a bleep is louder than modulation therefore
in skip conditions with QRM sometimes its not obvious when the other station
has cleared. In these cases you will hear the bleep (especially if its
distinctive) and know hes/shes finished talking. Also if you loose him/her
in the skip you may recognise them on a different frequency so be able to
try and finish your QSO.

There you go ,simple isn't it. Now please stop using HTML and reply in a
form that all can read.

Right, you can't hear any of the transmission, just a beep for end of transmission, just
the kind of station I would want to communicate with. Sooo, if all you can hear is a
beep? Pretty much useless on 27 MHz. Run your "bleep" if ya want, I always hear
the stations I want to communicate with, no beep! BTW, upgrade your shit, this is 1999-
than you too can handle HTML!! Ova n out......BEEP...<<== just for you Maggie.

You may have have overlooked the fact that I have replied to you already in HTML so
"updating my machine" is another silly thing to say. There are a few people on here though
who's machine cant handle HTML so it is for those people that I raised the point for. BTW
when you finally, if ever, grasp the concept of communication on SSB especially in skip
conditions then you might realise what a good thing a bleep is. While at the moment you
probably just have a 40 Ch AM set you wont appreciate it.
Also the stations you speak to are your little group of schoolboy type locals so DX'ing
wont appeal to you. You probably haven't got a good antenna either. If you have then please
feel free to enlighten us with what equipment you have. I take a guess at a midland 100m
and a DV27.
Have a lovely afternoon and I look foreward with interest to your next fabulous
posting.......yours in awe, Graham

Those amps are not capable of producing 140 RMS watts.
On a stricktly RMS (average-reading) meter, the wattage
will decrease with modulation if the carrier is set to
100 watts. Using a Bird 43 as an example, the amp would
have to be capable of 420 peak watts to hold a reading
of 140 at 100% modulation. Even at 100 watts, it would
have to be capable of 300 peak watts to hold the 100
watt reading at 100% modulation. In normal set-ups,
those amps can hold a maximum RMS reading of about 75
watts. Any more than that and you start seeing sig-
nificant amounts of backswing with modulation.

Hehe, these damn factory made amps are just pieces of shit. The only
thing about the peak meters, is it doesn't correct the amp meter on my
power supply, so when the needle on the peak meter swings up, the current
needle will swing down. Piece of shit eh?

You should know all about that. You're the one
that went off-topic first. All I did was respond
to the off-topic cracks made about my ham license
and my website. You can't have your cake and
eat it too. I'm not going to stay on-topic
and allow you to make unchallenged, off-topic
comments.

> if you knew anything about cb like you claim,
> you would know that my email is the same as my callsign so its just as good my
> name.

That's crap. You're hiding behind it. It's not
any call sign that I recognize. What country and
radio service is it from?

When I'm reading the newsgroup I look at the sender
name. When I see something other than a legitimate
full name, I wonder how much credibility I should
lend to the things this person says. It's like
when you shop for a product. Is the manufacturer
proud enough of their product to put their name on
the product? The same goes for posts. Are you
willing to back up what you say with your true
identity? If not, what's the difference between
yourself and any other anonymous troll?

> 73 tim 2-IR-082

thats simply not true. some people like me want to see the rms power so we know if were backswinging and sounding like crap. what are you a salesman for the peak kit?
peak meters are for ego boosting when it comes to cb's. i couldnt imagine tuning my amp by using a peak meter.

Your argument is weak. Using a fake identity here is alot different
from broadcasting your home address on CB. It's a question of
credibility. A fake identity decreases your credibility and makes
you a liar (not to mention paranoid) right from the start.

1689. Another REDNECK Joke

Newsgroup: rec.radio.cb
Date: 1999-08-12 00:00:00 UTC
From: Robert Walling <Robert.Walling@wcom.com>
Message-ID: <37B31C22.65349319@wcom.com>
Source record: 1689

Two rednecks were walking down the road, when they came upon a sheep with it's head stuck in the fence. One redneck looked at the other and said "Dang!! This is too good to resist!!!", and proceeded to jump the fence to the other side and started banging the sheep. After awhile, he said to the other redneck, "Y'all want some of this too?". "No thanks", the other replied, "I don't reckon I'd be able to fit my head in there".

nice to see youve stopped with all the foul language and other things of the sort. i guess some people have to be shown there faults before they realize them. like i said before if you have ever spent anytime on 11 meters you would recognize that my callsign comes from the International Radio group from holland. going off topic and making personal attacks are two different things totally. you have continued to insult people you know nothing about. http://home.wxs.nl/~19ir01 check out this web site. you may learn a little about the way 11 meters really works. also see www.sugardelta.com and www.alfatango.org

whats the matter nobody on the repeater right now and theres nothing else to do but mess with cb'ers? its been my experience that most techs are just cb'ers that go to radio shack and buy a study guide so they can tell all the other cb'ers how smart they are now because they are a ham. (not saying thats you but just a general experience) off topic is fine but personal attacks against people you dont even know isnt

Have you tried shielding the modem. RF has a way of messing with the buss, and since your talking 27Mhz, i'd bet that your real close to the buss speed, and that is where you problem lies. I would start with HEAVY shielding the modem, and a good ground to the shield.

1694. Radios and an Amp for Sale

Newsgroup: rec.radio.cb
Date: 1999-08-12 00:00:00 UTC
From: jouc@oit.edu
Message-ID: <37b3274e.757818@news.jps.net>
Source record: 1694

Okay I lowered my prices and added a couple radios, hopefully y'all can take these items off of my hands. Thanks!

Cobra 148 GTL-ST AM/SSB Mobile Fairly New, just bought it last year. It's in great condition. It hasn't been modified yet, has the MB8719 PLL. Includes Diesel 4-1 microphone $125

Cobra 200VM Variable Modulator
200 Watts maximum output, but is variable so you can turn it down if you like. Works both AM/SSB no problem! 4-10 watts input. $125

Uniden Washington AM/SSB Base Station
it has a Expo 100 kit installed which gives the upper and lower funnies, clarifier slides 5khz to the right and 4khz to the left, the cosmetics and working condition are 9 out of 10, includes cobra ca-72 desktop dynamike plus. $185

Uniden PC-66XL AM Mobile
Hasn't been modified yet, is in great condition. Only had it for less than a year, box and manuals included. $55

Cherokee CM-10 Mobile AM Radio
it is unlocked for 23-30mhz communication, it has dual watch, 7 ch memory, scan, memory scan, repeater function, all sorts of computerized goodies. Box and manuals included. The cosmetics and working condition are 10 out of 10. $75

Clarion JC-211E Mobile AM Radio
this is a clarion under the seat cb radio, there is an LED display, channel switch, squelch and volume all on the microphone. I think this is a good way to prevent burlgers from breaking in and stealing your cb. This radio is exceptionally loud. The unit is in pretty good condition, however the mic is scratched. $45

Shipping and Handling will vary

Ask me if I give a shit! If you are so concerned with me jumping in a conversation when it has nothing to do with me, then why would YOU "jump" into a conversation where I was simply trying to help someone out? I'll show you and everyone what I mean.

*****QUOTE FROM BILLS MESSAGE TO ME*****

It's a Cobra 29 LTD. It's one of the most popular radios in the free world. The reason I haven't exactly specified what his problem is is because I'm too lazy to go to my file cabinet and pull out my service manual for that radio. You (Hank Aaron) are really pushing this. The problem is that you haven't provided any real help at all. You're tooting your own horn like you're an expert, but all you post are excuses for you own ineptitude.

******** END QUOTE ********

So Bill. Please explain to me what the hell erked you that I was helping someone out. Its funny Bill, I did not make any derogatory statements towards you. I was only trying to help this particular gentleman out a little, and this is how YOU replied! Why Bill? Enlighten us all. Or, are you going to avoid this question here in this thread as you did in the thread of your post to me? Im still waiting.

"Hank"

1696. Re: CB used to disable car electronics ?

Newsgroup: rec.radio.cb
Date: 1999-08-12 00:00:00 UTC
From: russ <russr@mediaone.net>
Message-ID: <TSFs3.14025$W11.248954@wbnws01.ne.mediaone.net>
Source record: 1696

Well lets see if this helps you out. I'm sure that at least it will cause some dramatic debates here. Especially from the people that think they know, instead of knowing the facts. Most cars manufactured in the past 10 years or so rely on a small onboard computer for emissions, and performance. these onboard computers use processors that operate at 16Mhz to 66Mhz. The most popular being between 25Mhz and 33Mhz. As you can see right around the CB or 27Mhz range. Now I have seen a 250w amp cause some problems in the cars they have been used in, such as poor acceleration, early detonation, and so on, but not totally disable the car. The reason is that the transmission frequency was so close to the main processor speed it corrupted the data of the onboard computer causing these minor problems. So I imagine if enough power was used you could do the same to the cars in front of you, however this is very unlikely. Auto manufactures caught onto RF problems early on, and the new onboard computers are shielded very well. PC Magazine had a small Y2k article this month and it briefly touched this. I hope that this explains it well enough for you. Don't worry about all the others that think they know better. they base their thoughts on opinions and ego, not facts. The government uses stuff similar to this to disable an enemies tracking system, radar, and so on. They call it Electronic Jamming (used in the Gulf War)......

Bill,

With all due respect (that you have not deserved). I believe it is due to the fact that people do not wish for crazy jerkoffs to visit them at their home. There ARE people that like to know posters real names, so that they can gather information on them... In other words Bill. If I told you my real name is Hank Aaron and somewhere along the line, I say I live in Georgia, then someone can perform a search ON THE WEB for a Hank Aaron in Georgia. Now, it doesnt take a rocket scientist to gather enough

information to find out where that person lives. Just as you have ADVERTISED yourself, that you have a Bird 43, guess what Bill? If someone gathers that information on YOU, they know if they take a crack at your house when no one is home, they will at least get a $350+ Bird Wattmeter. Do you see now Bill? So, if not using my real name and home email address is lowering my credibility to you, then so be it. I believe it is if anything lowering my STUPIDITY. Its all just common sense Bill.

Hank (petty little anonymous man tooting my horn)

1700. Re: What is the deal "QSL Cards"

Newsgroup: rec.radio.cb
Date: 1999-08-12 00:00:00 UTC
From: Gary Danaher <gdanaher@flash.net>
Message-ID: <37B32B0B.F06EBD40@flash.net>
Source record: 1700

Perhaps you are assuming that they actually WANT your card. If you send a card to someone with no strings, fine. If you get a card back, great. If you send a card to someone expecting one in return, you are going to have to pay the postage. An SASE at bare minimum for stateside cards. Pay a little extra for the Canadians. That's the way that qsl cards work; if you want a card you will pay for it.

You're overcomplicating the matter. Use the context of an
average-reading wattmeter and I think you'll have a clearer
understanding of what I said.

> so mr bill. You should spend time testing these ideas of yours instead of
> trying to sound smart with your incorrect figures and so called facts.
I've tested my facts. I'm very familiar with the that
amp and how it performs. The question here is about
the readings themselves and the test set-up used to
obtain them more than how the system sounds. Based
on the original post, the system sounds okay--that's
what indicates to me that the readings are inaccurate.
The reason for the inaccurate readings is likely due
to a problem in the test set-up--most likely the use
of an inaccurate meter and a slightly reactive load.
There's nothing to get exited about here. This is
just simple, progressive logic applied to a situation
that contains a number of unknowns.

> Are you
> sure you are not related to the captain of the exxon valdez? You know, the guy
> who didn't see alaska floating right there in front of him?

This is the scientific way in which you back up your
statements? And you feel okay about telling me my facts
and figures are incorrect? Your post contains nothing
of substance--it's merely an unsubtantiated opinion.
As such I'll give it all the thought it deserves as I
reach for the delete key.

My RF Parts catalog lists it as a 70 watt device
with a boatload of gain (16 dB). It's a wonder
the amp is stable and not showing signs of over-
drive. The logical choice for replacement tran-
sistors in a Pride 100 would be the MRF454. I'm
surprised the RF Parts people didn't recommend
them.

A spec sheet and history of the device might be
nice to look at.

1706. Re: CB used to disable car electronics ?

Newsgroup: rec.radio.cb
Date: 1999-08-12 00:00:00 UTC
From: Gary Danaher <gdanaher@flash.net>
Message-ID: <37B32ECD.288532AD@flash.net>
Source record: 1706

Problems are often created by using power in a vehicle, but it is occurring in that one vehicle, not another several feet away. Sit down and calculate the near field power (that's what we are really talking about here). See how much it drops off at even a short distance, and then calculate how powerful your siganl would have to be to create similar power field 50 feet away, where another car might be located. You could always attach a log periodic antenna to the car, but that might be a bit obvious.

Something else you may want to consider is the courtesy tones used on Amateur repeaters. They claim the tones are used to let the other ops know when the transmitting station has unkeyed. But if the transmitting station is a mobile or is barely able to access the repeater, then you would likely hear lots of beeps as he fades in and out of the repeater. So the beep on a repeater is not always a good indicator of when a station unkeys. But a beep on a simplex qso (without a repeater) especially on SSB would be of use since you would never hear the beep unless the transmitting station actually unkeyed. But I never hear hams complain about courtesy tones on repeaters, probably since those tones are considered an acceptable practice on repeaters.

It would help you get your point across, not to mention that folks might
take you a little more seriously, if you learned the proper use of
simple words, like "let these guys KNOW" instead of "let these guys no",
as one example.

Oh? You obviously haven't tuned around 10 meters when it is open for
short skip. I hear plenty of stateside cbers on 10 meters. A lot of
truckers use 28.085 (along with other 10 meter frequencies) as a regular
channel now.

You're having the same problem Russell is. My
explanation is designed to explain the behavior
of an average-reading wattmeter. Waveform analysis
agrees with my position when understood in the
proper context.

Here's an example: Let's say a CB transmitter
that's producing a 4 watt carrier shows a peak
envelope voltage of 20 on a scope when running
into a purely resistive 50 ohm load. Using a
1 kHz sinewave input signal at the mic jack to
100% modulate our 4 watt carrier we'll see that
at the crest of the positive-going modulation peak
the peak envelope voltage doubles, and at the
crest of the negative-going modulation peak the
voltage is reduced to zero. Over any number of
full cycles the peak envelope voltage averages
back to our original 20 volt figure. The average
RF wattage remains the same as well. The increase
in voltage (and wattage) due to the positive modulation
in cancelled out due to the decrease in voltage and
wattage caused by the negative modulation. That's
the context in which my earlier statement applies.
As far as an average-reading wattmeter is concerned,
the positive and negative modulation swings cancel
each other out, leaving the original carrier wattage,
assuming the positive and negative modulation swings
are equal and opposite (symmetrical). In many CB
systems they are not. That's what causes an average
wattage reading to increase or decrease when modulation
is applied. If the positive-going modulation peaks
are larger than the negative-going modulation peaks
the average wattage will increase when modulation is
applied. The opposite is also true, and is very common
in CB systems that employ linear amplifiers.

I hope this helps to clear up any remaining confusion
you and Russell may be experiencing.

> Yes, it will.

It depends. If I key up at 100W and hold the mic far away and speak in a quiet voice, the peak output may only reach 140W, but I would sound quiet and undermodulated, not bad or muffled. On the other hand, if I'm running an amplifier with a max output of 140W, and a 4W carrier input produces 100W out of the amp, then if I modulate my exciter to peaks of 8W, then the output from the amp would be clipped at 140W instead of reaching 200W and would sound distorted.

>come on friend you no as well as i do this bill will never pass.

And then again it just mite pass too with blessings from the FCC. With all the crap going on on 11 meters, these two bills will look better and better in the lay public's mind.

The following text is a copy from the 8/8/99 Macomb section of the Detroit News (www.detnews.com) and should be of interest to CBer's.

WARREN -- Sean Carney's neighbors on Ida Street get cranky when they can't use their phones, watch TV or listen to the radio.
Many neighbors grouse that Carney's CB conversations with people as far away as Florida are unwanted and disruptive because they interfere with the devices in their homes.
"The noise -- bits and pieces of conversations -- can come at any hour of any day. It's not right," said Dave Springer, a bicycle salesman who lives two doors from the Carney family.
The spat on the once-tranquil south-side street has moved beyond asking a neighbor to comply to keep the peace. At least 15 families have taken their complaints to the city attorney in an effort to put a halt to a nuisance they say they can't live with.
"There's a lot of static on the phone. We also hear words coming out of the TV that aren't good words," said Ester Affeldt, a homemaker who has lived on the street since 1960.
Carney, a train conductor and gun shop owner who has lived on Ida for four years, denies cussing on his 4-watt, 40-channel Uniden and Washington CB but acknowledges he's bothering other people.
Even a friend says he hears Carney talking through home computers and stereo speakers that are turned off.
"I want to be a good neighbor. I've got to live with these people," Carney said. "But I'm within the law. What can I do? I'm not going to stop using my CB because I have a right to use it."
Carney uses his CB to meet friends. He gets together with many of them at Warren coffee shops "to shoot the breeze face-to-face. I just like talking to people."
Neighbor Charles Shade went to the city to represent the street after the FCC said the broadcasts meet agency guidelines. Carney is within the law, because he filters the signal coming from the 18-foot-tall antenna on top of his house.
"I've done my homework," Carney said. "I've bought filters, a new microphone and run an 8-foot ground wire from my antenna into my back yard. I can sympathize with everybody's concerns, and I wish there was an easy

quick fix. But there has got to be a different kind of resolution than leaving my CB off."
Shade said being a good neighbor is paramount.
"This is a very serious nuisance. It's out of control," he said.
City Attorney George Constance is studying whether the Ida Street broadcasts qualify as nuisances. A decision is expected by the end of the month.
Councilman George Dimas calls the situation "an invasion of privacy" and says he'll amend the law if it doesn't do the job as it exists.
"Saying this is a nuisance is saying it politely," Dimas said. "We have to provide these people with relief. This is totally inexcusable."

The handwritting is on the wall CBer's.

I recently (3 days ago) heard a CBer's kid on 28.350 here in NY. All
morning long it was "Hellllllllllllo,Hellllllllllllo......" then dad
in his best CB lingo called someone. Then the kid came back on with
the same nonsense. Guess their fed up with the CB band too...

Both are good radios but the pro640e has a problem with it's display.
The segments burn out rather quickly and I suggest that you keep the DIM
button in at all times. Because the S/RF meter is part of the channel
display the replacement of this is rather tough. I have been able to
actually cut the s meter from the channel part and substitute a double
seven segment display from an old Uniden satellite receiver. But it is a
tough job! Other than this the 640 is a nice rig with it's backlite
knobs.

I'm just spicing things up a bit. I've been participating
in this newsgroup for three years now. I've seen alot of
ups and downs in the exitement level. This is usually a
pretty rowdy forum. When it begins to get dull someone
usually jumps in and pisses some people off just to liven
things up. You have to have a thick skin and the ability
to let rowdy comments roll off, otherwise you'll just get
so upset that you'll discontinue participating. I've seen
that happen alot too. It's nothing personal, just one of
the ways some of the people here enjoy participating.

When I first started participating here, all I did was try
to help people with their CB radio problems. My posts were
informative, but incredibly dry and boring. Eventually that
got old. I still try to help people, but I also mix it up
a bit. This thread is a good example. I put out a dry,
informative post designed to help the guy with his problem.
Now, I'm mixing it up with you a little bit to add a little
spice to an otherwise painfully boring thread. In the end,
the result is the same; the guy will get enough info to
fix his radio if he's capable of fixing it. In the meantime,
you, me, and the rest of the readers get to read something
other than boring troubleshooting suggestions. If the guy
needs more help he'll ask for it, either here or by e-mail to
whoever he thinks is the most likely to be able to give him
what he needs. If that ends up being me, I'll work with him
in the normal, dry and boring manner.

I hope you now understand that nothing "set me off."
I'm just having fun participating in one of my favorite
newsgroups.

> Well, I appologize then pal. I'm sorry for your bad
> day. Actually my friend, you are probably one that would place a "Swing
> Mod" in this radio by placing a jumper in place of the anti-spiking diode
> huh?

That's not how you do a swing mod. You add diodes to the
existing spike diode (D8). That's also a simple way to reduce
radio's dead-key wattage without reducing the peak wattage
so that the radio won't overdrive an amp.

> Please tell me you do. But hey. I really dont know why you got so
> upset. "Then I could narrow it done (err down), as well as many of other

Did you enjoy yourself? I bet you did even though you
may not want to admit it here.

> You jumped the gun.. As far as "pushing it," Im sorry you
> WONT get off your lazy ass and get that service manual and help him then....

I've been out here long enough to know that if I don't
someone else will. And if no one does, I'll very likely
get a personal request for more specific help via e-mail,
or another post asking for more help will appear here.

I'm hoping the guy already came up with a truth chart
and has fixed the radio. In many cases that's what
happens. While we're out here screwing around, either
the guy has already fixed the radio or is corresponding
with someone via e-mail who is willing to go the distance
with him. He, very likely, already has what he needs,
and couldn't care less about us.

> or alteast post what PLL (Phase Locked Loop) IC (Integrated Circuit) is in
> the Cobra 29 LTD.

There's no rule regarding how much help anyone is supposed
to give. I offered info that should point the guy in the
right direction; that's as far as I chose to go.

> Oh, why dont you share with us how to directly modify the
> PLL in the 29 LTD (not SSB radios)for extra channels? I have a feeling you
> are going to tell us you cannot.

You can. The trick is to use the T/R shift function.

> Well then, why the hell would I remember
> what PLL is in it?

What difference does it make? You're not obligated
to help the guy. As soon as his radio is fixed he
won't give a shit about you or me. That may sound
callous, but it's true. In my 3 years out here I've
helped literally hundreds of guys. Only a handful
really appreciate it--the rest take it for granted
or even laugh at guys like you or me with the thought
that we should get lives rather than staying out here
handing out free help/info.

> Just as you did not make any effort to remember it
> either...as made abundantly clear when you told us you had to look in your
> "service manual." See I lent out my SAMS Photofact 56, 217 and Lou
> Franklin's CB PLL Data Book, but you have yours..

Of course I do, but that doesn't mean I have to help
that guy fix his radio. I aimed him at a source where
he could get his own just like I had to.

> I believe it is the uPD2816 (which utilizes a 6 bit BCD/ROM programming),
> but as I said, I cannot remember.

Believe it or not, that guy will somehow manage to
repair his radio regardless of whether or not you
remember what PLL chip is in it.

1725. External speakers

Newsgroup: rec.radio.cb
Date: 1999-08-12 00:00:00 UTC
From: werob@aol.com
Message-ID: <19990812175348.21787.00000248@ng-fm1.aol.com>
Source record: 1725

Please excuse me if this seems like a dumb question, but are all external speakers pretty much the same. I have a Uniden that works fine but I have it on all the time with the volume kinda loud, it can become hard on the ears. Other than just shutting the radio off is there one with more base or a way to eliminate the piercing tones from some radios. In the ham radio store I have seen speakers that are a lot more expensive. Does that make them better?

> aj
I'd be interested in your evaluation of the three
Uniden radios....HR2510, HR2600, and Lincoln. The
basic radios are all the same in that they can all
be modified with the Chipswitch IC.

Hi sorry about the time that has goin by but was very bezsey so here is the
latest update for you on the Yaesu stuff here if the last offer he has had
that seams to be around the same cost.
1 Saturn turbo
1 1000 base am/ssb has mod done for 25.000? to 28.000? that I daunt no
1 148gtlf with all the mods
1 grant the export one it has am/fm/ssb and a sw that has bands a to e
1 small amp I forget the name but it is small 4 watts in and it give a swing
of 50 or 75 watts that guy said that it was a nice booster for skip on the
11 meters

So there you go that's what was the last thing that look good to the guy so
i will keep you all up to date ok thanks..

It's the "little group of schoolboy type locals" that
get such a charge out of the beeps and echos.Toys.
Can't say I have never heard an rbeep on ssb, I just don't
ever recall it, ever. Traffic heavy on 27.365
right now, but the toys are absent, as always. As for
equipment, how did you know?

I think the thought here is that since CBers use handles to identify,
there is no way of knowing who is who. Hence, everyone is stereotyped.
It's very similar to racism. If a CBer is heard on 28 MHz, it means that
ALL CBers are on 28 MHz. It might be a generalization, but again, since
there is no way to pick the few guys out and prosecute them, everyone
gets blamed. The good guys get blamed for the bad guys' behaviors.

Greetings!

While Dancing with the Mouse on Wed, 11 Aug 1999 13:05:15 -0400 (EDT),
the Modem interrupted with an MNI from "thumper485@webtv.net (Chris)",
and the MotherBoard buffered this to Video RAM:

:+]I have a chance to buy a used Uniden PRO640e or PC122. Which is the
:+]better radio and why?
:+]

The PC-122 is the easier radio to use, less buttons...still the same
chassis..

The Pro640 has...on top of what the PC 122 has...

Built in SWR,
Mic Gain,
Multi-color display,
Backit controls...
about 2" wider, and slightly longer.

If you decide not to buy the Pro640e, let me know - I want one!

Regards!
:+> Andy <+: |

1750. Re: SS225

Newsgroup: rec.radio.cb
Date: 1999-08-12 00:00:00 UTC
From: Jack Thurston <fire228@cybertrails.com>
Message-ID: <37B35AF2.5B16@cybertrails.com>
Source record: 1750

Bill,

All you are doing is adding to my confusion!
Besides, like i have just explained to a friend,
(I hope) I work with mostly hi level modulated
am transmitters and sideband equipment and am
interested in working with peak output figures!
Commercial AM Broadcast stations, even though
they use ammeters at the antenna feed to calculate
the total transmitter output, produce peak output
levels that are 1.25 - 1.50 times the unmodulated
carrier output! The NORM for AM broadcast
stations is 125 - 150% modulation levels. Don't
you remember the hams back in the 1950's and
their experiments with supermodulation techniques
using am transmitters? Hi level plate modulation
techniques with tube transmitters? I have
adapted their research and findings to solid
state equipment and, quite frankly, while the
possibility exists that I could learn something
from you, I have seen no evidence of this thus far.
Maybe you have a few topics that you excel at, but
this is not one of them!
Besides Bill, I don't remember asking you any
questions about all of this to begin with, and I
understand that this is not acceptable format in
a newsgroup. I simply passed along a piece of
information that I picked up from the manufacturers
of Bird wattmeters, and I would just guess mind you,
that they know more about their test equipment than
you do. Isn't that ham newsgroup looking better
and better to you all the time?

If I need anything out of you, I will ask!

Have a nice day,

Jack

PS I didn't ask you to explain the workings
of an average reading wattmeter. I don't use
them except on fm. Maybe you don't want to know
about the power levels in the upper and lower
sidebands of an am signal, but i sure as hell
do, especially when that is precisely where
the intelligent information or "my voice"

is contained, in the upper and lower sideband
portions of the am signal. The only thing the
"carrier" exists for is to assist the receiver's
detector stage in "demodulating" the signal
and making it sound like same signal that went
into the other guys microphone. Excessive
carrier levels are a waste!

1751. FS: Cobra 148F GTL peaked, tweaked and freq'd

Mint condition - Dial a watt, slider, freq's (223 extra), peak &
tweaked - can key (max) at 8 watts and PEP wings to 18. AM, SSB unit.

Comes with an Astatic D104 Minuteman II power mic.

This baby is a LOUD and CLEAR talker. I've DX'd from Southern Cal to
the East Coast and deep south without a problem at all!

$200

Also have a Cobra XL 350 in xlnt condition - 2 pills - 5-10 watts in,
180-225 wing.

$120

Prices are negotiable

Bill,

While I agree with most of what you have said below...

In the literature about the Bird Model 43, you will find that they say that
a 100 percent modulated AM carrier will show positive shift, to the tune of
50 percent (which would be totally correct for a 100 percent modulated
average reading).

How the fuck do you figure that an amplifier with one transistor is Class C?

The Class of bias that you see on a transistor is based on the bias applied to the base (in a common emitter configuration)..... Not a damn thing to do with the amount of active devices in the circuit...

And another thing, asshole, a 3 watt carrier would by UNDER 100 percent modulation with a PEP value of 10 watts fully modulated!

I suggest you stop trying to be such a dick and find out what the fuck you are talking about before you spout off with that loudmouthed hole of yourn again!

Gary,

I strongly believe you (and I) are enough not to bullshit one another. He could and many others could put it more tactfully, if anything be a little more politically correct. What I mean is, say this:

Some CBers operate on HAM freq.'s illegally.

vice, coming right out and saying:

CBers operate on HAM freq.'s illegally.

Then there wouldn't be a specific generalization in it all.

Regards,
Hank

There are a lot of people that buy export type rigs, without a
counter on them, that have no idea where they are. There are
also a lot of people that by a first radio of this type, and
are not told anything except that they have a LOT of channels.
I hear them all the time. MOST are easily educated, if done
correctly. Some just don't care.

Let me add that MFJ sells a small external speaker, (model 281)
that sounds pretty good. It's smaller than the RS speaker, and
it's only $9.95. I sold my $90.00 external Kenwood speaker, and
use one of these now. Sounds as good, if not better.

The President Lincoln is a 10 meter ham radio that is the French Uniden version of the Uniden HR 2510. With a chipswitch it will do 12 thru 10 meters, without a chipswitch but with the addition of a surface mount resistor it will transmitt from 26.000mhz thru 30.000mhz. The only difference between this and the 2510 is that the Lincoln has proportional variable power.

mr rfwatts, this good buddy is what is commonly referred to as a johnny come lately mudduck, who because he belongs to a so-called team of loosers aptly named the gooserider keydown team and who thinks the world revolves around his precious little keydowns and his precious channel 6, is therefore, gifted with radio knowledges unheard of in the cb world or any other rf world, that we know. he thinks he is an expert and thinks that what cb radio is all about is going to these rediculous keydowns and trying to outkey somebody, all the while knowing full well that this sort of silly activity does not prove a damn thing , except maybe who can cheat the best way or who has the most number of elements slung on their piece of junk truck. so if it is at all possible , my advice to you is to not try and reason with this door shaker in that he is slightly a bubble shy of plumb and also it is a good probability that cb radio is his life and that he needs to get a life, which i , the great one, on occasion , have informed this piece of trailer park trash, such , and before it is over , the most electrifying operator in the history of cb radio, will without a shadow of doubt, dutifully inform , this idiot, to quit cryin and start buying,,,,,,,thank you, thank you very much ,,,,,,,,,.....head out.....
Rfwatts wrote in message ...

They are in series man, not done with a splitter. Why are you so goddamn nosy? and why do you assholes post under assumed handles to talk shit? never could understand that? You read too much, why dont you get your ass out and experiment with directional mobile antennas and then you to might discover something new, and not just something someone shared with you or you read somewhere.

Yes, yes... :) I've seen my share. Yet illegal, it was funny nevertheless.
Gas pumps, vacuum cleaners, car washes, red lights (with poor RF sheilding),
cars (especially Fords [no offense to Ford owners]), etc, etc.

Scott,

Better yet, sweep the mic input with
an audio signal generator and notice that
between 300 and 3000 hz you will find a
frequency that will cause a sharp increase
in transmitter output. Now tune the
transmitter using this tone. Save the
vocal chords....

Jack

>amp.
>Not the "Real" Andy AMR 30

Actually Andy, thats not really true. My old DAVEMADE runs optimum at a 5 watt carrier. Thats a pretty high carrier if you ask me. And I've out talked other radios and amps with a lower deadkey and higher swing. What has been told to me, what I've read in most radio books and what I have experimented with, all came down to one proven point... less swing-more modulation, more swing-less modulation. Am I right? I've done it with that old DAVE and the so called "SEE-SAW" effect kind of worked out in my favor.

Any response will be duly noted and discussed...

Greetings!

While Dancing with the Mouse on Wed, 11 Aug 1999 22:16:52 -0700, the Modem interrupted with an MNI from "Jack Thurston <fire228@cybertrails.com>", and the MotherBoard buffered this to Video RAM:

:+]Bill,
:+]
:+] See, that's what I thought! If we look at
:+]a typical pattern, beginning at zero, this
:+]would be 0 degrees....as we follow the sine wave
:+]curve to the crest of the positive peak, this
:+]would be 90 degrees....back down to the 0 line
:+]would be 180 degrees....down to the crest of the
:+]negative peak would be 270 degrees and back up to
:+]the 0 line is 360 degrees makes one full cycle.
:+]
:+] Look at the figures at the positive and negative
:+]crests....90 degrees and 270 degrees....let me see,
:+]270 - 90 = 180....I believe that is correct. The
:+]positive and negative peaks are 180 degrees out of
:+]phase, occuring at two different instances in time,
:+]so how are they able to cancel each other out?
:+]
:+] Now I am no longer confused!
:+]
:+] Jack

This part is correct, only your missing the point regarding audio applied to this.

Linear Amps are one story, they simply amplify whats there. If it isn't clean, or something else is occuring, you see these events but it's a direct cause of another effect that is occuring within the radio itself.

Don't forget the audio being applied...

We are dealing with AM carrier, and sideband information.

Supposedly symmetrical.

In a properly operating radio. Assuming common emitter configuration.

There are moments when the forward power does change due to asymmetry. The produced wave, modulated with audio can have stronger positive

peaks, due to the applied audio waveform. This is mostly due to audio power that can affect bias drive, as well as collector voltage.

What you can see on an oscilloscope is higher forward peaks, with little change in negative peaks.

A second oscilloscope or spectum analyzer gives you a better overall picture of what I'm getting at. Negative peaks work against the voltage present at the amp stage, affecting bias and drive.

Due to the nature of power meters, forward peaks are detected at the same process the negative ones are. Only that the negative does not increase in level even though more audio power is being applied.

Positive going audio peaks summate to the collector voltage. E.G. - a carrier producing 10v ptp - with audio applied - can rise if the ptp voltage of the audio being applied, does exceed the collectors own input voltage.

Therefore, a possible asymmetry can occur, where positive audio peaks actually apply voltage drive to increase collector voltage and hence the output.

However, the part about bias at the base does come into play when negative peaks of audio - tend to reduce input voltage at the collector. The extra positive peak voltage can also affect the bias of the amp stage.

When this occurs, the voltage that is crossing over from the emitter thru the base junction, to the collector, is affected. Cutoff occurs and the device can change it's class from class AB, to C, or from class A, to class AB or C, when negative-going audio power subtracts from the collector voltage.

Since bias can be affected thru voltage at the collector, forced cuttoff tends to diminish, or shut off the transistor from conduction until bias voltage, collector, or applied audio voltage rises to force conduction again.

Since we are really talking about 2 types of waveforms, you might want to re-think or clarify your statement.

Pretty much all CB radios use a means not only to apply audio at the proper impedance and bandwidth, but to also apply voltage and current to peak out performance with some asymmetry involved - many people call this "swing".

Dealing with real life, negative-going sideband, or LSB waveforms are the most intolerant of excessive audio drive, for this effect is most pronounced due to the lowered frequency shift required to gain audio high-treble freqency response to envelope power. Base tones are less likely to affect cutoff due to the frequency cutoff filters used to limit tonal range the amp stage is capable of amplifying, the lower base tones are lower in frequency shift, and although can affect bias

to a point due to their nature, the amp stage can recover quickly.

What many can hear in high-frequency tonal production of overdriven audio on the lower sideband in SSB radios, is actually an undertone full of bass response due to the clipping and cutoff, either the amp stage itself, or the previous stages of audio amplification and filtering before they are mixed to form sideband information.

In a typical AM-only radio, the audio mixer stage is in the driver and final. An RF frequency developed from previous stages, is applied to the base of the driver, and an audio+DC voltage is applied to the drivers' collector, this is then amplified further thru the base of the final and appliciation of more audio+DC is applied to the collector of the final to allow for 100% full modulation and then some.

Not to be confused with SSB methodology, which use either balanced bridge, or balanced modulator - which produces a frequency higher than audio but still lower than the CB channel frequency [typical topic] - but changes envelope power and frequency at an audio based rate, before it's applied to the amplifier stage. And this method uses steady regulated collector voltage, with base voltage varying at the audio rate, mixed with another IF frequency mixed in a prior stage - which then the driver and final stage combines steady CD from the collectors, and varying audio based RF bias at their bases, to produce a audio based RF signal with no carrier but at the proper frequency. This can be amplified in a normal fashion only with a small base-bias DC voltage to change the class of the amp stage from class C to class AB to provide a symmetrical waveform as would be found in both a typical SSB CB or a linear with switchable AB/C biasing.

Regards!

Why would you tune a radio/amp with a whistle? None of your
vocal frequencies are that high unless you're a soprano.
Tune for a whistle and you'll only swing good with a whistle.

(OK. Start the flames!)

Greetings!

While Dancing with the Mouse on 12 Aug 1999 21:53:48 GMT, the Modem interrupted with an MNI from "werob@aol.com (Werob)", and the MotherBoard buffered this to Video RAM:

:+]Please excuse me if this seems like a dumb question, but are all external
:+]speakers pretty much the same. I have a Uniden that works fine but I have it
:+]on all the time with the volume kinda loud, it can become hard on the ears.
:+]Other than just shutting the radio off is there one with more base or a way to
:+]eliminate the piercing tones from some radios. In the ham radio store I have
:+]seen speakers that are a lot more expensive. Does that make them better?

Not necessarily, an extension speaker can be anything from a simple speaker in a box, to something quite elaborate.

It all depends on what you would rather listen to.

There is a lot to be said about the quality of the "on-board" speaker used in many of todays models.

I've had chalkboard scrapes easier on the ears than listening to a woman screaming something about "Who do you do this with?" on your standby channel...along with other non-such personal triva that it's a wonder why my ears are still "on"! ;-)

But, seriously, if you get tired of listening to it, I empathsize - they are not the best when it comes to long trips. Even Rush Limbaugh tends to drone on, mixing in with the muffler noise of the vehicle you've been trying to pass for the last six miles...

Basically, go around to different places and they should allow you to hear the speaker before you buy it. Then you can select the tone or find one with this feature [attenuation filter pad/tone control] to suit your tastes, and buy one.

Your ears will love you for it.

One reminder, if you buy a Bose Wave Machine, I think you've spent too much...;-)

But, find the one you, and your ears like, it's priceless - especially if you want to forgo looking into buying Beltones...;-)

Try your RF gain, and Squelch controls too, if you have them, make the radio do the work, not your ears!

Regards!

Okay I have a Cobra 148 GTL-ST and a Cobra 350 XL... I've taken
people's advice on turning the radio's deadkey down.... I brought it
down to 1 1/2 watts deadkey and swings to 4. The amp now swings
forward but only up to 200 watts... am I not peaking the radio to full
potential or is there an adjustment I need to make with the amp?
Thanks for all your help, everyone.

Chris

hi joe. this isnt a new subject but an important one none the less. for some true dx activations, like the one going on now in ethiopia and others similar its understandable to ask and get a dollar for the card because the whole trip can be very expensive and we dont have dx foundations (although theres the new dxeleven11 thats starting for this purpose) the hams have big groups that sponsor dx trips but theres nothing here for us. the reason its getting out of control is because stations soon found out if there in a rarer location (even if there at home) then people will still send the dollars and they can get quite a bit of money. almost all the cuban stations are doing stuff like this with alot of others around the world following. thats why there are so many SES and /dx or /0 stations on the air these days, its not because there from a rare place but because they want a dollar. watch out for the italin kilo papa group because there the biggest dollar hunters of all, but dont confuse them with the real KP knight patrol group from the usa. 73 TIM 2-IR-082

wrote by peter Kp2o3:
11 Meters Has Gone Digital

Yes, that's right! In the recent few months, you will notice an increase of digital information being passed from one operator to another. Numbers, numbers and more numbers! By digital, I do not mean RTTY or packet radio. The transmissions are VOICE. Operators first calling their own unit "number" over and over again, sometimes for several hours at a time. Then a progressive number is sent to them, followed by a bunch of other numbersï¿½. P.O. Box numbers, division numbers, zip code numbers, and signal report numbers. The band is filled with people sending and receiving only numbers. This is truly a shame. When you stop and analyze exactly what is happening, I am sure you will agree that this is a waste of good radio equipment, and not exactly what you would call "quality time" spent on the air. When an operator is on air all afternoon transmitting only his own unit number, receiving a QSL card from some exotic division (number), is not a very big reward. This is of course considering the time spent chasing another operator who will only return a NUMBER, and who will spend only 10 seconds with you. The same afternoon could have been spent cultivating new friendships and exchanging cultural information in a few nice QSO's.

Stroke Stations In the past year there seems to be a sharp increase of "stroke stations". xxx stroke xx. On a day when the propagation is good, almost all frequencies are occupied with these "Dollar Hunters". Dx-peditions,

special event, and special activations. For any one of these stations, there are hundreds and sometimes thousands of operators sending dollars for their special QSL card. To give you an idea of real stupidity, 1 GP "stroke" NA, Op. Dominico running a "special activation" from Naples Italy. My question is, how can you run a "special activation station" from a place where there are hundreds of other active operators. (willing to exchange QSL's for free) WHO would be so silly to send a dollar for this QSL?? The answerï¿½ 3,727 people!! Op. Dominico has issued 3,727 progressive numbers since April 3rd, and is probably still going strong as you read this newsletter. He can be heard exclusively on 27.515 USB everyday for sometimes 10 hours a day. Hurry, don't miss your chance to collect this "very special QSL". It's a real bargain at only one US dollar, and of course, only a few hours of your time trying to get your "proggie" through the big pile up.

>Feed point impedance can vary with coax length - VSWR cannot.

If your feed point impedance changes, won't your VSWR change
also as a function of forward and reflected power?
Using VWSR = (1+SQR(Reflected/Forward) / (1-
SQR(Reflected/Forward)) it would seem that the VSWR would have
to change with an impedance change?

From: Jack Thurston <fire228@cybertrails.com>
Message-ID: <37B44745.5121@cybertrails.com>
Source record: 1822

Examples:

Let's keep this simple!

Joe and Frank both have a 200 watt amp.

Joes amp keys 40 and modulates forward to 200
200 - 40 = 160........carrier = 40
power in upper sideband = 80 watts
power in lower sideband = 80 watts
Franks amp keys 120 and modulates forward to 200
200 - 120 = 80........carrier = 120
power in upper sideband = 40
power in lower sideband = 40
Joe and Frank live exactly the same distance away from
a guy named Bill....He says that Joes signal is
noticably louder than Franks. Why?

Because the manner in which Joe "drives" his amplifier
allows for twice as much power to be developed in
the sidebands. Joe also enjoys some other benefits
as well.

Joes amp:

runs cooler
lasts longer
sounds better
requires less frequent repair

Even though Joe doesn't quite understand it all well
enough to explain it, it works! It's okay Joe, you're
ahead of the game!

Joe, Frank,
And Bill....tnx
for the story!

By careful wildcat. "Jolting Jeff" is already embarrassed enough by associating with us maleducated CBers. You wouldn't want to upset him to the point where he'll say something rash. I hear Jeff (known herein as "JJ") also regulates and moderates the alt.radio.kids.walkies.talkies Newsgroup in his spare time, which keeps those pesky 11 year old future CB wanna-be's in line. What would we do without people like him, and isn't the world a much better place because of it?

Bravo Jeff. Im sure the ARRL has some sort of plaque for such efforts, as a matter of fact, Im personally going to draft a letter to Congressman Elhers because I feel good deeds should'nt go "un-noticed".

HI There I have bin ask to see if some of you can help me and the guy out the Saturn turbo base the guy sent a another message saying that there is a small problem with the base the mem will not work the split and the swr and the rc cuts out now would that be a big job to repair and if so how much do you think it would cost.

And now the other question the grant export I cant find the price on this radio is it old CUs there is no place that I find that have it and the cost for it as used I no that the 148gtlf sells for around $150.00 used and the cbs 1000 that one I have seen going for about the same $150.00 but I was told that it is not made anymore so that's it for the radios and now for the small amp it is called a masketo sorry about the spelling but I think that you no what I am talking about you no the bug that bits and sucks some blood well that is the name of it I have not see any like that and would like to no if thay are any good and the cost of one, Sorry about all the questions its just the guy no the prices of hf gear but not to much about cb.s and small amps so thank again for the help and will look forward to getting back to you all..

Hi John, I went to the site and it looks not that much big diff from the 99 and they said that it would give you 1/2 dB more then the 99 so that means that the 99 is 3 1/2 db so the new one would be 4 db. I myself have tried the 99 and it not bad for local bad not to good for distans and that's why I changed to a maco 5/8 it works good all over the place and have no bad reports about it so maybe you should look at the maco OK..

1838. Re: What is the deal "QSL Cards"

Newsgroup: rec.radio.cb
Date: 1999-08-13 00:00:00 UTC
From: Joe <2nc605@my-deja.com>
Message-ID: <7p1sodctu1@nnrp1.deja.com>
Source record: 1838

Thanks for the reply Gary.

I should have been more specific. The only stations that ask for the donation are stations that ask me to send them a card. They give me their information and ask me to include the buck.

I have about 5 QSL cards, and they were all initiated by the person whom I was talking to. They gave me their info, I sent the first card, and then they sent one back. So far I have paid for my end and they have paid for theirs.

I enjoy DXing, and I like to note the call sign, operating conditions, date, etc. of the stations that I contact. What I find is that some stations simply start giving their QSL info and then ask for the buck. The info is always for a QSL manager in a different division from theirs. I understand this "donation" to be the processing fee for their organization. I have simply been ignoring these operators for a long time, and I will probably keep doing so. However, they ask for the card.

Do you think that, since they want the card, they should ask for my info and send me a buck? I posted this message because I would like to start collecting these cards, and I almost sent the buck. I can't bring myself to do it. If I was initiating the QSL with a goal of filling up a wall, sure I would include the SASE.

Gary, it just seems to me that a QSL conformation should be as you put it...no strings. However, I don't think that operators should ask for a card unless they intend on returning one.

Maybe I will never be one of those operators with a wall full of QSLs but I still enjoy the DX. --Joe

Gee's Jeff. Why did you stop co-posting to the CB Newsgroup. Apparently a "one-way" debate is easily won eh? I guess it is one way of satisfying ones ego.

>Jeff KH6O writes with poly-syllabic heinous hyperbole (I bought a new dictionary):
> I was told that you claimed to have been a long-time licensed ham who
> turned in his license in the 70s due to some dispute with the ARRL.

Sorry, but your email pals (or your comprehension of my posts) are sadly mistaken. No-one ever said I was ever a "long time" Ham (unless one considers 3 years or so a long time). I actually discovered what assholes *many* Hams were early in the hobby and I had the sense to abandon it because my personality would have me arguing with them every moment (hmmmmm, is it 1977?). Pomposity and self-rightousness are two traits that I really didnt/dont need to acquire, especially from many of these emotionally stagnant, and societally naive group of individuals.

In addition, at that time, I saw the ARRL as an "ill progressive" and "self serving" organization dedicated to the interests of a vocal minority who spent the majority of their time looking backwards as compared to forwards (Im told things haven't changed much; I guess there is something to be said for consistency). And finally, running home everyday to eat a meal, then to give my wife a peck on the cheek, and to finally retreat to a radio shack until 2 AM every night wasn't really what I considered as "having a life".

Actually the biggest reason is because I don't look good wearing a "Pocket Protector".

>Jeff KH6O writes even more heinous hyperbolae (oops):
>If that were true, then you would certainly know the licensing procedures of
> the period in question. (No Saturday testing, no General exam given
> outside an FCC office, not possible to upgrade from General to Extra
> in two weeks.)

Sorry Jeff, but if you did comprehend my posts, you would have noticed that I did say that I took the General Test at the Customs House located in Boston, MA which was a FCC branch office in 1975. We disagree about the test being taken on a Saturday, which if you do some investigative work on your own, (I don't consider this conversation worthy of the effort), you will find
that Saturday tests were given at this location quite frequently. I'm sure there are some "still living" Amateurs up here in New England that can drag their hemorrhoids over to a computer to verify this for you, if you are that

concerned. Or perhaps the illustrious ARRL can provide you with an old testing schedule.

As far as the Extra Class ticket was/is concerned, I repeated in my posting what I was told (which I am assuming by the responses was incorrect). Unlike those who become physically and sexually stimulated by Ham nomenclature, I really don't consider the Amateur License structure worth remembering. I was never an Extra Class ticket holder nor would I ever consider wasting time on such an endeavor, again, "A life is a terrible thing to waste".

Now, if you want to debate Constitutional Law with regards to Telecommunication Issues, Ill by more than happy to engage you in such because I wouldn't be citing second hand information.

I sign my posts with my true name including
my last name (unlike you).

My e-mail address contains my callsign only
because it was a convenient monicker to use
when I set up my ISP account.

> everytime ive questioned anything
> you say you right away start out with personal attacks and other childesh
> things instead of proving your point right or wrong.

That's untrue. All I do is respond. When you
go off-topic to give me shit, I go off-topic
to respond. The same goes for my technical
points. When someone challenges one of them,
and I see it (I don't read the group everyday
or every post in every thread), I respond with
a counterpoint or an admission that I was wrong.

> maybe you have a little
> knowledge to share and if you do thats great but stop with the blatent
> advertising of your web site because we dont care at all.

YOU don't care at all (or are envious/jealous);
that's the truth of the matter.

> we have all seen your
> ads and if we wanted to look at it we would.

The reason I recommend reading the stuff on my site
is so that I don't have to type out the same stuff
over and over again. That's why the website exists.
The same questions are asked out here over and over
again. My site is just an FAQ answer site. When
I see a question that's answered on my site, I give
a brief answer and a recommendation that the person
read the applicable stuff that's at the website if
a more comprehensive answer is needed. So, what
you're really against is me saving my own time so
that I can read more threads and help more people,
and saving bandwidth by not having to repost the

same stuff over and over again. Your position means
that you are for wasting time and bandwidth. Maybe
now you'll see how poor a position it really is.

I don't understand. On an RMS meter the reading could
never reach 140. With a 100 watt dead-key, the reading
will *decrease* when modulation is applied, assuming
an AM input signal, due to gain compression of the
positive-going modulation peaks.

The only way that amp will show 140 on an RMS meter
is to drive it with a single frequency SSB signal.
That wasn't the case in this particular situation.

1846. Radio Gear FS

Newsgroup: rec.radio.cb
Date: 1999-08-13 00:00:00 UTC
From: Oris <oris@dirtball.com>
Message-ID: <37B471E7.33969CB0@dirtball.com>
Source record: 1846
Cross-posted to: rec.radio.amateur.misc,rec.radio.cb,rec.radio.swap

I have three peices of radio gear for sale.

1) Yeasu FT 2400 50 watt 2-meter moblie $150.00 you pay shipping and insurance. This is a good little 2-meter rig apperance wise its a 7 on a

scale of 1 to 10. It comes with a keypad mic. Drope me a line if you are

interested.

2) A Kenwood TS 120 moblie HF rig. This rig is a very simple HF rig. It covers the convental HAM bands 80 thru 10. It does about 70 watts out and is a again a 7 on a scale of 1 to 10. I'm asking $300.00 for the radio mic and power cord.You pay for the shipping and the insurance.

3) Dentron Clipperton L HF amplifier. I have $550.00 in the amp, with all the work I have invested in this amp that is what I have in it. But in all farness the amp isn't worth what I have in it so my asking price is $400.00. You pay shipping and insurance. This amp has been redone inside. I replaced the caps last year. It now ask 220uF caps in the power supply in stead of the 100uF and it also has new 1N4007 diodes too. The band switch is also new. The 572bs have very low use. I put new

572bs in the amp back in Feburay. I think I have fired it up 3 times since then. This amp is my back up. I run a SB 220 and I have another amp coming from Maryland for a back up amp. Its a pair of 813s built in the 1960s by my grandpa. Fullwave bridge powersupply the whole nine yards. So I don't need the Clipperton L any more.

I'm looking to get another HF rig. My TS 930 power supply crapped on me.

I have ordered a new Power supply board for the rig and I just put a new

PLL board in the rig. I really will not know what the damage is until I get the new power supply board installed.
I will also listen to any trades that anyone might have to offer for all of the equipment above. Heck I'll swap it all for another WORKING TS-930S/AT with the AM filter or TS-940S/AT with the AM filter.
I also have the Narrow CW filter that I would trade for the 6 KHZ AM filter that goes in the TS-930S/AT.

Scout leader found hanging from tree has foot amputated

Sunday, August 8, 1999

Associated Press

ORLANDO - Doctors have amputated the left foot of a Boy Scouts leader who was found hanging naked upside down from a tree as part of what investigators described as a solo sex act.

An hour-long surgery to amputate Clark Anthony Getz's foot above the ankle was successful, a spokesman for Orlando Regional Medical Center said Friday.

Getz, 42, has been hospitalized since Monday after authorities found him dangling from a rope about 12 feet off the ground. Blood flow to his feet had been cut off for more than 24 hours.

The left foot "developed an infection that needed to be taken care of before it got worse," said hospital spokesman, Joe Brown. "When you deprive a part of the body of oxygenated blood for 24 to 26 hours, tissue begins to die."

Doctors ran tests on Getz's feet, which were swollen, discolored and barely had a pulse when he was taken to the hospital. A prosthesis would be considered.

Florida Park Service rangers heart Getz yelling Monday before they found him in a densely wooded area near the Lake-Sumter County line. His wife had reported him missing Sunday after he didn't return from a bicycle trip.

Getz had tied himself from a tree but had gotten tired and couldn't pull himself up to untie the ropes, said Sgt. Nick Pallitto, a spokesman for the Lake County Sheriff's Office.

His situation was captured on a video camera that he set up.

"He was doing something sexually to himself. I guess that's his thing," Pallitto said Tuesday. "It may have been an autoerotic situation."

I don't understand either. If someone sends me a QSL card first, I am happy to reply with my QSL card. The whole "send a dollar" thing is stupid, plus it has generated lots of fakes as well. Many people go on the air, saying they are a special event station so people will send money. This is about the only time I will send money, if it's an authentic special event station, they are sending tons of QSL's. Once I confirm it's a real event station, I will send my QSL and $1 for their QSL.

Although, a QSL really isn't needed with special event stations since a progressive number is all you really need for awards with many DX groups if the station is special event...

You never see anyone asking for $$ for QSL cards in the ham radio hobby, from what I can tell..

Sorry but you are mistaken. Generally if a card is needed from stateside, you are expected to send a stamped return envelope. No extra money is required, but if the card you are requesting is a dx station via a stateside manager, then a buck, or 'green stamp' is helpful in paying for the cards. Not required for stateside, but if you send about 10% with a green stamp enclosed, and spread it out, everyone is happy. For dx stations, postage has become ridiculous. A card from Germany now costs DM3 to post, and that is about US$1.85. If you need a card from Germany or Switzerland, you will enclose two green stamps. Japan is marginal at a buck with a postage rate of Y110. As far as a dx station actually needing a North American card, that is remote. Most commonly it is the other way around, so you pay postage. International Reply Coupons are also available for postage prepayment, but that is another can of worms. There is a buro system of exchanging cards but it is slow and doesn't always work. There is no such thing available for CB and perhaps should be, but it would take a national organization to handle it, and we all know that that isn't going to happen in our lifetimes.

Billy-Bob was walking into town one day wearing nothing but his gun and his boots.

Just as he began walking down Main Street, he was confronted by the Sheriff. "Hey, Billy-Bob, ya mind if I ask you what you are doin' walkin' down Main Street wearin' nothin' but your gunbelt and boots?"

"Well Sheriff, it's a long story."

"I ain't going nowhere," said the Sheriff.

"Well Sheriff, a couple hours ago I ran into Mary Lou in the saloon. We had ourselves a couple of drinks and then we started to feelin' kinda frisky and Mary Lou said, "Why don't we go out to the barn?"

So we did. Then we started getting real close and cuddin' and smoochin' and Mary Lou said, "Why don't we go out back and go up to the top of the hill?"

So we did. He continued, "We started cuddlin' and smoochin' some more and the next thing I know, Mary Lou had taken off all her clothes and she suggested that
I do the same. So I did, all except my gunbelt and boots. Then Mary Lou laid down on the ground and spread her legs apart and said "Okay, Billy-Bob, go to town!"

And here I am Sheriff!!!

I have three peices of radio gear for sale.

1) Yeasu FT 2400 50 watt 2-meter moblie $150.00 you pay shipping and insurance. This is a good little 2-meter rig apperance wise its a 7 on a scale of 1 to 10. It comes with a keypad mic. Drope me a line if you are interested.

2) A Kenwood TS 120 moblie HF rig. This rig is a very simple HF rig. It covers the convental HAM bands 80 thru 10. It does about 70 watts out and is a again a 7 on a scale of 1 to 10. I'm asking $300.00 for the radio mic and power cord.You pay for the shipping and the insurance.

3) Dentron Clipperton L HF amplifier. I have $550.00 in the amp, with all the work I have invested in this amp that is what I have in it. But in all farness the amp isn't worth what I have in it so my asking price is $400.00. You pay shipping and insurance. This amp has been redone inside. I replaced the caps last year. It now ask 220uF caps in the power supply in stead of the 100uF and it also has new 1N4007 diodes too. The band switch is also new. The 572bs have very low use. I put new 572bs in the amp back in Feburay. I think I have fired it up 3 times since then. This amp is my back up. I run a SB 220 and I have another amp coming from Maryland for a back up amp. Its a pair of 813s built in the 1960s by my grandpa. Fullwave bridge powersupply the whole nine yards. So I don't need the Clipperton L any more.

I'm looking to get another HF rig. My TS 930 power supply crapped on me. I have ordered a new Power supply board for the rig and I just put a new PLL board in the rig. I really will not know what the damage is until I get the new power supply board installed.
I will also listen to any trades that anyone might have to offer for all of the equipment above. Heck I'll swap it all for another WORKING TS-930S/AT with the AM filter or TS-940S/AT with the AM filter.
I also have the Narrow CW filter that I would trade for the 6 KHZ AM filter that goes in the TS-930S/AT.

I've seen cash machines go out of service from RF. I also seen
people kick on the vacuum cleaners and turn off the pumps at
gas stations. I know of other things to mess up with a big
radio, but I won't mention them! BTW, I have made one guys car
stall at a red light, but that was the exception not the rule.
He'd start it. I'd kill it. Four times before the light turned green.

No hyperbole (not "hyperboly") has emanated from this keyboard, but I
am again flattered that you consider it as such.

>Hey I hear your buddy Porkbutt is back in
>business selling illegal amplifiers.

No, you read some anon (like yourself) saying that; but as we've
learned from you, nothing an anon writes should be believed.

>Perhaps you and Jeff should email him the Part 97 Rules and Regs.

Questions concerning use and sales of amplifiers were contained
in the exams he took; he's well aware of the regulations.

Take care,
Jeff

1-Turn off radio

2-Unscrew coax connector

3-Unplug AC line from wall

4-Place radio in closet or trash

5-Enjoy peace and quiet

There are no ham communications on the freeband. Notice I did not say
there were not any persons on the freebands who also hold a ham license,
but their communications on the freeband is not ham communications, is
is simply communications on the so-called (but non-existant)
"freebands".

: > slightly increase with 100% modulation.
:
: Those amps are not capable of producing 140 RMS watts.
: On a stricktly RMS (average-reading) meter, the wattage
: will decrease with modulation if the carrier is set to
: 100 watts. Using a Bird 43 as an example, the amp would
: have to be capable of 420 peak watts to hold a reading
: of 140 at 100% modulation. Even at 100 watts, it would
: have to be capable of 300 peak watts to hold the 100
: watt reading at 100% modulation. In normal set-ups,
: those amps can hold a maximum RMS reading of about 75
: watts. Any more than that and you start seeing sig-
: nificant amounts of backswing with modulation.

Which is why I thought that the readings may have both been made on an
RMS meter.

robertg (robertg@iname.com) wrote:
: On Wed, 11 Aug 1999 04:05:27 GMT, warnergt@ptd.net (George Warner)
: wrote:
:
: >The SWR is not different; it is the same all along the coax (disregarding
: >minor coax losses). No multiple is 1/2 wavelength coax is required.
: >Listen to tnom@muck.net. Stop farting with coax length.
:
: George;
: This is only true if the antenna is matched. A 1/2 wave
: (electrical length) shows the antenna impedance at the feed point.
: So if you can't insert the meter at the antenna, a 1/2 is a good
: starting point to use to match the antenna with the meter inserted at
: the transmitter. After you match the antenna, then the length of coax
: shouldn't effect the SWR.

No, it is true regardless of how well the antenna matches the coax.

And there is no need to know the true VSWR, in most cases. Just tune the antenna for minimum VSWR (not necessarily the same as minimum reflected power) - regardless of what that happens to read on the meter. You will then have just as good a match as if you did the matching with the VSWR meter at the antenna.

: as an example:
:
: A typical 1/4 whip will have a feed point impedance of around 36 ohms.
: Feed that with a 1/4 of 75 ohm coax, the feed point impedance will be
: around 50 ohms.
:
: Feed the same antenna with a 1/2 of 75 ohm (or 50 ohm) coax, the feed
: point impedance will be 36 ohms. The SWR is not the same all along
: the coax, unless the antenna is matched. So you can match an antenna
: by changing the length of coax.

You are confusing feed point impedance with VSWR - they are NOT the same. Feed point impedance can vary with coax length - VSWR cannot.

I've heard of putting a KW-7 Firestik on top. I think Firestik
also makes a replacement top especially for that purpose.

I wouldn't want to turn a 5/8 into a 1/2)-:

To answer the question in the header: Maybe they're too drunk or so damn
stupid to care or realize what they're doing. Personally, I'd stay
between
26.7 and 27.995 and prefer to only go a couple each way. The difference
in noise level is tremendous, and probably won't bother anyone. (Those
Mexicans run you off of every channel, even 19!)

>I have a question about properly setting up my amplifier. It seems
>that when I whistle into the mic the amp tends to backswing. How can
>I alleviate this problem and get more forward swing?
>
>Chris

I had the same problem. But stay away from Peak Reading meters. All it does is it pumps up your ego (no offense).

What had happened was, well one of two things...

- First, I was under-powering the amplifier. When I bought my first linear (Shooting Star 225) I had it wired straight to my car battery with 8 gauge wire. Not good. "More fire in the wire" meaning larger gauge, helped out a bit in supplying a little more current for the mudduck amp to perform. Later I got a bigger alternator to suffice the current supply and added an extra battery for ample voltage and current storage/usage.

-Second, when I got my bigger driver, a 1993 DAVEMADE M400, the radio was not tuned to drive the DAVE. Since I burnt the 225 by not keeping it in a cool area (stupid me), I had my radio hopped up a little to talk barefooted. An 8 watt carrier and a 17-20 watt swing was a little too much for the DAVE and my BIRD meter back-swung (with a 500 watt slug) in RMS from roughly 190-200 to 160-165. I couldn't believe what I saw. My VSWRs were right around 1.3:1 on ch20 and I had to get rid of the negative swing. Had my doctor massage my radio down and he showed me the results of a 4.5 watt carrier with a 12-15 watt swing (depending if I'm shouting or not) and the DAVE RMS'ed around 180-185 watts and forward swung to 300. I saw that it wasn't too bad with a 14.5 volt system and stayed with it until I moved here to the Valley of Death.

So, with the brief history and all, check your setup. Current/voltage supply, wire gauge, and carrier all play a role in optimum swing (not like you didn't know that I hope). Check it out and see if that helped.

My twin ABE's...

The A99 is not a 5/8 antenna, it's a half wave over a quarter wave.

Message-ID: <37b3e922.2422133@news.jps.net>
Source record: 1885

Okay, I'd like to thank everyone for their great advice. I turned down the dead key on my cobra 148gtl to about 1 watt when I talk normally or use the ahhhh sound it goes up to 4 watts... and the amp itself swings forward nicely, which I wanted. It seems more logical for it to swing forward and draw more current while swinging forward. Then deadkeying, and talking watching it swing backwards. That is what I want right? My modulation to swing forward? Thanks for all the help guys!

Well, the differences are not quite that simple. The 2600 will also
not convert to 11 meters without a chipswitch brand IC chip.
And I'm beginning to love my Lincoln. The Mrf455 final allows this
radio some additonal power the 2510 used to have to struggle to do.

1887. Re: No more colinear antennas?

Newsgroup: rec.radio.cb

Source record: 1887

Hello Joe: Good question! The antennas I think your talking about are the aluminum vertical 5/8 wavelength, with the four ground radials. Which are excellent CB Base Antennas. The term "colinear" has been misused by some of the CB Antenna manufactures, from years ago. Colinear, means to have vertical antennas, stacked or added on top of each other.

The MaCo V58 is available from CB Radio Dealers. It is a 5/8 wavelength CB Base Antenna, with four ground radials. The other popular 5/8 wavelength Antennas where the Hy-Gain Penetrator 500, and the Avanti made, AV-170 Sigma 5/8 and AV-190 Saturn.
There was a vertical 1/2 or 5/8 wavelength that was sold many years ago, that the manufactures called a "Colinear" but really wasn't a real colinear type antenna, but I can't remember the model number or make! If my memory servers me right, there was a "Colinear" CB Base Antenna, that had three ground radials, and four top hat loops at the top of the antenna.

There is a guy who handles parts and pieces, and probably even the hole antenna assembly, from the old out of business Avanti Company. He is:
HC Van Valzah Co.
38W 111 Horseshoe Dr.
Batavia IL 60510

Phone: 630-406-9210. tell them Jay sent ya.

The Hy-Gain Penetrator 500, stop being manufactured in the 1978 to 1979 time frame.
I have rebuilt a few Penetrator 500 antennas, and had a small amount of replacement parts made up in a machine shop, to get a few of old and damaged Penetrator 500 5/8 CB Base Antennas together for some of the locals out here in the Mojave Desert, everybody wants a Penetrator 500, it seems like.

I replaced my A99 with a ABS1600, and replaced the ABS1600 with the Penetrator 500. Its a great antenna, I get out pretty good, and don't cause interference to my neighbors as I did with the A99.

The old Comstat 25B is a great radio. Good luck, and let me know how you make out.

Jay at jay123a@qnet.com .... In the Great Mojave Desert, just down the road ah ways from the fillin station.

Message-ID: <7p14nrrmc1@nnrp1.deja.com>
Source record: 1889

What's the deal with operators asking for a donation of one US dollar in return for a QSL confirmation card. I enjoy DX and do not mind exchanging cards but I refuse to pay the extra buck. The way I see it, I'm already spending a dollar for the card&postage. Why do some organizations feel I should pay for their half as well. I'm not saying that a dollar is going to break me, with as little as I exchange these things, but don't you agree that it should be a 50/50 arrangement?

Does anybody send the "donation"?
Am I being unreasonable?

Thanks, Joe

A car is used to drive on roads, an airplane is used to fly through
the air. Both a CB and a cordless phone transmit a voice. We want
clean clear audio on both. I don't think echo makes this type of
communication better. Its like walking up to your friend and telling
them to go into the nearest tiled room so you can have a conversation
with them. It is incredibly irritating and annoying.

I think that the main problem is amplifier use on 11-meters. But, how
do we enforce the no amplifier rule without trampling on the rights of
law abiding cb users?

The problems of morons on the radio irritating the general user will
always be there. But amateur radio has that problem too, albiet not
as bad.

Welcome to CB! ;-P

> Other than just shutting the radio off is there one with more base or a way to
> eliminate the piercing tones from some radios.

Yes, some have high filters. Another, even better way,
is to use a speaker from a cheap, rack-mount stereo
system. This assumes that you have room for it. In
other words, you're on a base station. Every second-
hand store that's worth a damn has at least a half-
dozen of these speakers laying around that you can
get for nearly nothing. Look for one that has a single
8 or 10 inch speaker in it. The large speaker will
shift the frequency response toward the low (bass) end
which will make listening to radio (be it CB, ham or
even a scanner) alot more pleasent.

> In the ham radio store I have
> seen speakers that are a lot more expensive. Does that make them better?

Not necessarily. The good thing about ham stores is
that they'll let you listen to all of them, and still
take back the one you choose if it doesn't sound right
on your system.

I don't know if you're talking about a base or a mobile.
For a base the answer is given above. For a mobile,
you're sort of stuck with the small speakers. This
is only my opinion, but my favorite small, external
speaker is the amplified Radio Shack speaker. Whoever
designed it did a very good job of tapering the frequency
response. I've never heard another small speaker that
was more pleasant to listen to. Another plus is that
since it's amplified it gives the audio IC in your radio
a break. The audio IC in CB radios is a common failure
since it's overworked. The second you turn your radio
on, no matter what mode (CB, PA, receive, transmit) you're

using, the audio IC is being worked. It never rests
unless the radio is off. My point here is that anything
you can do that gives the audio IC a break will make
your radio more reliable in the long run.

I hope this helps.

No it won't.

> voice, the peak output may only reach 140W, but I would sound quiet and
> undermodulated, not bad or muffled.

That's not true. The frequency response will still be
limited causing you to sound muffled/pinched/crispy/
sizzly.

In reality, it's actually better to overmodulate when
running too high a carrier--you'll sound louder and
more like everyone else. In other words, the overdrive
distortion is actually less noticeable when combined
with overmodulation distortion.

Of course you don't have to believe me. Set up a
monitor receiver and run some experiments of your
own to verify.

> On the other hand, if I'm running an amplifier
> with a max output of 140W, and a 4W carrier input produces 100W out of the amp, then

> clipped at 140W instead of reaching 200W and would sound distorted.

That's the situation we've been talking about all
along.

The only problem is that you need to differentiate
average and peak power in your analogies. The
situation is even worse when you understand and
consider positive peak compression/distortion.

I'm being 100% honest when I say that this was a very
intelligent post.

Big kead-keys (those large enough to cause backswing
on an average (RMS) reading) meter don't produce positve
results.

Sideband is exactly the thing that proves his point.

Sideband signals contain almost no carrier whatsoever,
yet they are the most efficient signals on the CB band.

Having the Bird sit still is OK.

The problem is that that's not what you were advocating
earlier in the thread. You were saying that it's OK
to backswing by something like 45% or more.

What's it gonna be?

What are you talking about?

Perhaps you need to differentiate input power from output
power.

You missed the post where I set these guys straight. It's
not my fault you don't know how to work your newsreader.

Based on what I've read of yours, I doubt you could
understand enough of the info on my site to put together
an unbiased opinion. Your posts to these threads are
based on nothing more than an instinctual, knee-jerk
hatred of me because I continue to embarass you at every
turn.

due to the current draw of even a small amp the battery pack would have to
be rather large....

This post goes to show that you're closed-minded and
not capable of seeing the forest for the trees.

I don't have a problem with never talking to you
again--it'll be your loss since I understand
your concepts but you don't understand mine. In
reality, I'm not so sure you even understand the
concepts that you claim to here. If you did, why
would you be out here asking questions in the first
place? There's obviously something here that you
don't understand, but now you've become so defensive
that you'd rather not even learn.

Think about it. All I'm showing you is a different
way of looking at the same exact things that you
claim to already understand. If you're too close-minded
to see that, then to Hell with you.

Not that you were really trying to help me, but I appreciate
the thought based on the info that I quoted below.

"Don't forget the audio being applied." That's a huge
statement here.

Have you ever tried to prove that? It won't work with a 43;
only the "new" APM (Average Power Meter). Enough people have
figured out that the 43 is no more accurate than any other
wanna-be RMS wattmeter. Alot of people (myself and Dennis
#12 included) are not happy about that--and Bird knows it.
Now, if you REALLY want a true, average-reading meter, you
have to buy an APM and a new batch of slugs. Here's another
tidbit to chew on: the APM has no peak-reading kit option.
In other words, it's only an average-reading meter. So, to
get +/-5% accurate average AND peak readings, you'll need a
fully equipped APM (for average readings) AND a 43P (for peak
readings). Isn't that just great?

This is why I tell people to read the AM Tutorial that's on
my website. All of these little tidbits are there--complete
with formulas and techniques so that you can verify what I'm
saying. In other words, I never expect anyone to believe
what I say. I always try to provide practical experiments
so that you can prove it to yourself.
